COURSE LXXXVIII

edited by M. GHIL

Director of the Course

and by R. BENZI and G. PARISI

VARENNA ON LAKE COMO

VILLA MONASTERO

14 - 24 June 1983

*Turbulence and Predictability  
in Geophysical Fluid Dynamics  
and Climate Dynamics*

1985

NORTH-HOLLAND

AMSTERDAM - OXFORD - NEW YORK - TOKYO

## INDICE

(incomplete list of contents) (not yet finalised)

1. Introduction . . . . .  
2. Geophysical flows . . . . .  
3. Climate dynamics . . . . .  
4. Predictability . . . . .  
5. Attractors . . . . .  
6. Dimension . . . . .  
7. Entropy . . . . .  
8. Invariant measures . . . . .  
9. Multiplicative ergodic theorem . . . . .  
10. Frequency locking . . . . .  
11. Scenarios leading to chaos . . . . .  
12. Dimension of attractors . . . . .  
13. Some recommended reading . . . . .

with the corresponding page numbers (not yet finalised)

M. GHIL, R. BENZI and G. PARISI - Introduction: turbulence, geophysical flows, predictability and climate dynamics . . . . . pag. XIII

PART I - The onset of turbulence . . . . . » 1

D. RUELLE - The onset of turbulence: a mathematical introduction.

0. Introduction . . . . .	»	3
1. Strange attractors and sensitive dependence on initial condition . . . . .	»	4
1'1. Differentiable dynamical systems . . . . .	»	4
1'2. Types of DDSs . . . . .	»	4
1'3. Sensitive dependence on initial condition . . . . .	»	5
1'4. Attractors . . . . .	»	5
2. Routes to chaos . . . . .	»	6
2'1. Some simple technical facts . . . . .	»	6
2'2. Generic bifurcations of an attracting fixed point . . . . .	»	7
2'3. Frequency locking . . . . .	»	10
2'4. When does sensitive dependence on initial condition occur? . . . . .	»	10
2'5. Scenarios leading to chaos . . . . .	»	11
3. Ergodic theory of differentiable dynamical systems . . . . .	»	14
3'1. Theorem (multiplicative ergodic theorem) . . . . .	»	14
3'2. Choice of an invariant measure . . . . .	»	15
3'3. Entropy (Kolmogorov-Sinai invariant) . . . . .	»	15
3'4. Dimension of attractors . . . . .	»	16
4. Some recommended reading . . . . .	»	16

**A. LIBCHABER** – The onset of weak turbulence: an experimental introduction.

1. Basics of thermal convection . . . . .	pag. 18
2. Bifurcations from a limit cycle . . . . .	» 20
3. Frequency lock-in . . . . .	» 20
4. Saddle node bifurcation and intermittency . . . . .	» 22
5. Pitchfork bifurcations and the period-doubling cascade . . . . .	» 24
6. Hopf bifurcation and the Ruelle-Takens scenario . . . . .	» 26

**G. JONA-LASINIO** – Small stochastic perturbations of dynamical systems.

1. Preliminary remarks . . . . .	» 29
2. Motion along the flow . . . . .	» 30
3. Motion against the flow . . . . .	» 31
4. The invariant measure . . . . .	» 34
5. Infinite-dimensional dynamical systems . . . . .	» 37

**PART II – Fully developed turbulence . . . . .** » 43

**H. TENNEKES** – A comparative pathology of atmospheric turbulence in two and three dimensions.

1. Introduction . . . . .	» 45
2. Some properties of flow with friction . . . . .	» 47
3. Entropy and information . . . . .	» 49
4. Vorticity dynamics . . . . .	» 52
5. Energy and enstrophy in three-dimensional turbulence . .	» 54
6. The enstrophy cascade in two-dimensional turbulence .	» 57
7. Spectral characteristics of three-dimensional turbulence .	» 59
8. Characteristic exponents . . . . .	» 63
9. Spectral characteristics of two-dimensional turbulence .	» 65
10. Epilogue . . . . .	» 68

**U. FRISCH** – Fully developed turbulence and intermittency.

1. Simple ideas and misconceptions about turbulence . . . .	» 71
1.1. Sharp transitions can occur when the Reynolds number is varied . . . . .	» 71
1.2. The flow is unstable and unpredictable . . . . .	» 71

1'3. Trajectories of marked particles are unstable and unpredictable . . . . .	pag.	72
1'4. Turbulent flow enhances transport . . . . .	»	73
1'5. High-Reynolds-number turbulence has a wide range of scales . . . . .	»	74
2. Fully developed turbulence: intermittency as a broken symmetry . . . . .	»	76
3. Turbulence with a spectral gap and predictability . . . . .	»	80
Appendix. - On the singularity structure of fully developed turbulence (with G. PARISI) . . . . .	»	84

C. W. VAN ATTA - Stratified-turbulence experiments.

1. Introduction . . . . .	»	89
2. What should be measured? . . . . .	»	91
3. What can be measured . . . . .	»	92
4. Buoyancy effects in vertically homogeneous unsheared turbulent flow . . . . .	»	94
5. A laboratory experiment . . . . .	»	97
6. Some geophysical measurements . . . . .	»	103
7. Résumé . . . . .	»	105

S. A. ORSZAG - Lectures on spectral methods for turbulence computations.

1. Introduction to spectral methods . . . . .	»	107
2. Applications . . . . .	»	117
2'1. Introduction . . . . .	»	117
2'2. A transitional instability . . . . .	»	118
2'2.1. Nonclassical character of transitional instabilities . . . . .	»	118
2'2.2. Three dimensionality of transition . . . . .	»	118
2'2.3. Instability of two-dimensional nonlinear travelling waves . . . . .	»	118
2'2.4. Competition between two-dimensional pairing and three-dimensional instabilities . . . . .	»	121
2'2.5. Spurious (numerical) turbulence . . . . .	»	122
2'3. Computer simulations of turbulence . . . . .	»	122
2'3.1. Turbulent channel flow . . . . .	»	122
2'3.2. Turbulent spot . . . . .	»	124
2'3.3. Taylor-Green vortex . . . . .	»	124
2'4. Subgrid scale turbulence closures. . . . .	»	126
3. Conclusion . . . . .	»	127

PART III – Turbulence in geophysical flows . . . . . pag. 131

R. SADOURNY – Quasi-geostrophic turbulence: an introduction.

1. Introduction . . . . .	»	133
2. Barotropic turbulence . . . . .	»	133
2'1. Nonlinear transfers . . . . .	»	133
2'2. Statistical equilibria. . . . .	»	136
2'3. Stationary solutions: stability . . . . .	»	138
2'4. Forced stationary turbulence: phenomenology . . . . .	»	139
2'5. Direct or semi-direct simulations . . . . .	»	142
2'6. Spectral slopes and ZIR intermittency . . . . .	»	143
2'7. Emergence of quasi-stationary vortices . . . . .	»	144
3. Baroclinic turbulence . . . . .	»	146
3'1. Simplified formulations . . . . .	»	146
3'2. Statistical equilibria. . . . .	»	148
3'3. Turbulence with large-scale thermal forcing . . . . .	»	148
Appendix. - The quasi-geostrophic approximation . . . . .	»	152

R. HIDE – Thermal convection in a rotating fluid subject to a horizontal temperature gradient.

1. Introduction . . . . .	»	159
2. Geostrophy . . . . .	»	160
3. Regimes of thermal convection in a rotating fluid annulus	»	162
4. Patterns of regular nonaxisymmetric flow . . . . .	»	166
5. Atmospheric flows . . . . .	»	169

D. J. TRITTON – Experiments on turbulence in geophysical fluid dynamics. - I: Turbulence in rotating fluids.

1. Introduction . . . . .	»	172
2. Homogeneous turbulence . . . . .	»	173
3. Vibrating-grid turbulence . . . . .	»	173
4. Large vortex-generating mechanisms . . . . .	»	179
5. Turbulent shear flows . . . . .	»	181
6. An experiment on free shear layers . . . . .	»	182
7. Stewartson layers . . . . .	»	189
8. Concluding remarks . . . . .	»	191

D. J. TRITTON – Experiments on turbulence in geophysical fluid dynamics. - II: Convection of a very viscous fluid.

1. Introduction . . . . .	»	193
2. The experiment . . . . .	»	193

3. Observations . . . . .	pag. 194
4. Geophysical application . . . . .	» 198

S. CHILDRESS - An introduction to dynamo theory.

Part I: Survey of the principal concerns of the theory . . . . .	» 200
1. Introductory remarks . . . . .	» 200
2. Equations of the hydromagnetic dynamo . . . . .	» 202
3. Kinematic <i>vs.</i> hydromagnetic theory . . . . .	» 203
4. A disc model . . . . .	» 206
5. Some remarks on the underlying topology . . . . .	» 207
6. Cowling's theorem in a spherical core . . . . .	» 208
7. A necessary condition . . . . .	» 210
Part II: Projection methods for the kinematic problem . . . . .	» 211
8. General remarks . . . . .	» 211
9. Methods based on smoothing . . . . .	» 212
10. Braginsky's method . . . . .	» 215
11. Other results . . . . .	» 217
Part III: Hydromagnetic models . . . . .	» 218
12. Implications of linear and near-linear analysis . . . . .	» 218
13. Attempts to model the strong-field regime . . . . .	» 219
14. Concluding remarks . . . . .	» 223

JIM L. MITCHELL and T. MAXWORTHY - Large-scale turbulence in the Jovian atmosphere.

1. Introduction . . . . .	» 226
2. Turbulent planetary cascades . . . . .	» 226
3. Jovistrophic turbulence . . . . .	» 229
4. Global turbulent interactions and energetics . . . . .	» 230
5. Rossby-wave energetics . . . . .	» 234
6. Vertical structure of the Great Red Spot . . . . .	» 235
7. Conclusion . . . . .	» 239

PART IV - Predictability of geophysical flows . . . . . » 241

E. N. LORENZ - The growth of errors in prediction.

Part I: General aspects of error growth . . . . .	» 243
1. Introductory remarks . . . . .	» 243
2. The concept of error growth . . . . .	» 244

3. Simple numerical examples . . . . .	pag. 245
4. More general systems . . . . .	» 250
5. Approximate formulae . . . . .	» 252
 Part II: Error growth in the atmosphere . . . . .	
6. The general atmospheric problem . . . . .	» 253
7. A simple model . . . . .	» 255
8. Early experiments with global circulation models . . . . .	» 256
9. Later studies with global circulation models . . . . .	» 258
10. An analogue study . . . . .	» 260
11. The influence of smaller scales . . . . .	» 261
12. Concluding remarks . . . . .	» 264

C. E. LEITH - Two-dimensional coherent structures.

1. Enstrophy cascade in 2D turbulence . . . . .	» 266
2. Selective decay . . . . .	» 267
3. Method of anticipated vorticity . . . . .	» 268
4. Minimum-enstrophy modon . . . . .	» 270
5. Minimum-enstrophy vortices . . . . .	» 271
6. MEV M . . . . .	» 272
7. MEV C . . . . .	» 277
8. Conclusion . . . . .	» 279

D. K. LILLY - Theoretical predictability of small-scale motions.

1. Summary . . . . .	» 281
2. Introduction and scope . . . . .	» 281
3. Conventional estimates of small-scale predictability . . . . .	» 281
4. Atmospheric intermittency and effects on predictability . . . . .	» 285
5. Predictability of flow around widely spaced vortices . . . . .	» 287

G. D. ROBINSON - Scale and variance analysis of atmospheric motion.

1. Introduction . . . . .	» 290
2. The concept of velocity . . . . .	» 290
3. The concept of scale . . . . .	» 291
4. Scale analysis of atmospheric motion . . . . .	» 295
4.1. Raw observations and manipulated data . . . . .	» 295
4.2. Examples of data analysis . . . . .	» 295
5. Analysis of the advective interactions . . . . .	» 305
6. Some aspects of the global kinetic-energy cycle . . . . .	» 307

## PART V – Extended-range prediction and climate dynamics . pag. 309

E. KALNAY and R. LIVEZEY – Weather predictability beyond  
a week: an introductory review.

1. The problem of weather predictability: an example . . . . .	»	311
2. Predictability and global forecast error growth. . . . .	»	316
3. Predictability of time averages: internal dynamics <i>vs.</i> boundary forcing . . . . .	»	322
4. Predictability of long-lived atmospheric phenomena. . . . .	»	329
5. Current status of long-range forecasting . . . . .	»	338
6. Current research and future outlook . . . . .	»	342

## M. GHIL – Theoretical climate dynamics: an introduction.

1. Introduction . . . . .	»	347
2. Radiation budget of the Earth . . . . .	»	348
2.1. Global radiation balance . . . . .	»	348
2.2. Local imbalances and meridional fluxes . . . . .	»	350
3. Global energy-balance models. . . . .	»	352
3.1. A model for global temperature . . . . .	»	352
3.2. Stationary solutions and stability to perturbations	»	353
3.3. Structural stability . . . . .	»	355
4. Latitude-dependent models for surface temperature. . . . .	»	356
4.1. Horizontal heat transport . . . . .	»	356
4.2. Model formulation . . . . .	»	358
4.3. Stationary solutions . . . . .	»	360
4.4. Internal stability . . . . .	»	362
4.5. Structural stability . . . . .	»	364
4.6. Concluding remarks on energy-balance models . . . . .	»	365
5. Quaternary glaciations . . . . .	»	366
5.1. Climatic variability . . . . .	»	366
5.2. Paleoclimatic evidence of glaciations . . . . .	»	367
5.3. Geochemical proxy data . . . . .	»	368
5.4. The phenomenology of glaciation cycles . . . . .	»	369
6. Physical mechanisms of glaciations . . . . .	»	371
6.1. Internal mechanisms: model formulation . . . . .	»	372
6.2. Internal mechanisms: discussion . . . . .	»	375
6.3. Orbital changes . . . . .	»	378
6.4. Insolation changes and their climatic effect . . . . .	»	381
7. The forced behavior of a climatic oscillator . . . . .	»	385
7.1. Free oscillations . . . . .	»	386
7.2. Nonlinear resonance. . . . .	»	386
7.3. Entrainment and combination tones . . . . .	»	388
7.4. Multiple forcing: more combination tones . . . . .	»	390
7.5. Sharp peaks, aperiodicity and terminations . . . . .	»	392

8.	Periodicity and predictability . . . . .	pag. 394
8'1.	Phase errors and frequency errors . . . . .	» 394
8'2.	Measures of predictability . . . . .	» 397
9.	Concluding remarks . . . . .	» 399

R. BENZI and A. SUTERA - The mechanism of stochastic resonance in climate theory.

1.	Introduction . . . . .	» 403
2.	Formulation of the model . . . . .	» 404
3.	Some mathematical properties of Budyko-Sellers models	» 408
4.	Stochastic perturbations . . . . .	» 410
5.	Effects of stochastic perturbations . . . . .	» 412
6.	The orbital forcing . . . . .	» 415
7.	The mechanisms of stochastic resonance . . . . .	» 417
8.	Conclusion . . . . .	» 420
	Appendix . . . . .	» 420

THOMAS L. BELL - Climatic sensitivity and fluctuation-dissipation relations.

1.	Introduction . . . . .	» 424
2.	The fluctuation-dissipation relation (FDR) . . . . .	» 426
2'1.	Statement of the relation . . . . .	» 426
2'2.	Markov processes and the FDR . . . . .	» 428
3.	Will the FDR work? . . . . .	» 429
4.	Sampling problems . . . . .	» 435
5.	Additional remarks . . . . .	» 438
6.	Conclusion . . . . .	» 439
