# CONTENTS

NOTATION	xxi
1 THE SEMI-EMPIRICAL PICTURE OF TURBULENT SHEAR FLOW	1
1.1 The equations of fluid motion	2
1.2 A brief statement of the problem	4
1.3 The statistical formulation	7
1.3.1 Equations for the mean velocity	7
1.3.2 The energy balance equation for fluctuations	9
1.4 Two-dimensional mean flow as a special case	11
1.4.1 The boundary-layer equations of motion	13
1.4.2 The turbulent boundary layer: length and velocity scales	14
1.4.3 Universal mean velocity distribution near a solid surface	16
1.4.4 A simple way of calculating the friction drag due to a boundary layer	17
1.4.5 Empirical relationships for resistance to flow through ducts	18
1.5 Semi-empirical theoretical methods	20
1.5.1 The eddy-viscosity hypothesis	20
1.5.2 The Prandtl mixing-length model for flow near a solid boundary	20
1.5.3 The mixing-length model applied to a free jet	22
1.6 Some experimental results for shear flows	24
1.6.1 Mean and root mean square velocity distributions in duct flow	25
1.6.2 The turbulent energy balance	28
1.6.3 Mean and root mean square velocity distributions in a plane jet	31
1.7 Further reading	33
Note	34
References	34
2 THE FUNDAMENTAL APPROACH	36
2.1 The Navier-Stokes equation in solenoidal form	36
2.2 The general statistical formulation	39
2.2.1 Statistical equations and the closure problem	40
2.2.2 Two-point correlations	42
2.3 Reduction of the statistical equations to the form for channel flow as an example	45
2.4 Homogeneous isotropic turbulence	47
2.4.1 Isotropic form of the two-point correlation tensor	49
2.4.2 Length scales for isotropic turbulence	51
2.5 Stationary turbulence	53

2.6	Fourier analysis of the turbulent velocity field	54
2.6.1	The solenoidal Navier–Stokes equations	55
2.6.2	Homogeneity and the velocity-field moments	56
2.6.3	Limit of infinite system volume	58
2.6.4	The isotropic spectrum tensor	59
2.6.5	The Taylor hypothesis and the one-dimensional spectrum	61
2.6.6	Statistical equations in wavenumber space: many-time moments	63
2.6.7	Statistical equations in wavenumber space: single-time moments	64
2.7	The energy cascade in isotropic turbulence	65
2.7.1	The energy balance equation	65
2.7.2	Spectral picture: the Kolmogorov hypotheses	67
2.7.3	Interpretation in terms of vortex stretching.	73
2.8	Closure approximations	75
2.8.1	The Heisenberg effective viscosity theory	76
2.8.2	The quasi-normality hypothesis.	77
2.9	Some representative experimental results for spectra	81
2.9.1	One-dimensional energy spectra	81
2.9.2	The Kolmogorov constant	83
2.9.3	Energy transfer in wavenumber space	84
2.10	Further reading	86
	References	86
3	SOME RECENT DEVELOPMENTS IN THE STUDY OF TURBULENCE	88
3.1	Measurement techniques and data analysis	88
3.1.1	Anemometry	88
3.1.2	The laser anemometer	92
3.1.3	Time series analysis and computer data processing	98
3.2	Intermittency and the turbulent bursting process	100
3.2.1	Fine-structure intermittency	101
3.2.2	Intermittency and the energy cascade	104
3.2.3	Intermittent generation of turbulence: the bursting process	109
3.3	Numerical computation of turbulent flows	112
3.3.1	Direct numerical simulation (DNS)	113
3.3.2	Large-eddy simulation (LES)	118
3.3.3	The use of the Reynolds-averaged Navier–Stokes equations for practical calculations	125
3.3.4	An example of a two-equation turbulence model	128
3.4	Turbulent drag reduction by additives	130
3.4.1	Historical background	132
3.4.2	Polymer properties	134
3.4.3	The threshold effect	136
3.4.4	Maximum drag reduction	139
3.4.5	Drag reduction in fibre suspensions	140

3.5	Renormalization methods and the closure problem	141
3.5.1	Renormalization methods in statistical physics	142
3.5.2	Renormalized perturbation theory	144
3.5.3	Renormalization group (RG) methods.	148
