Contents

<i>Preface to the first edition</i>	page x
<i>Preface to the second edition</i>	xii
<i>Preface to the third edition</i>	xiii
<i>Acknowledgements</i>	xv
1 Some basic ideas	1
1.1 Planetary atmospheres	1
1.2 Equilibrium temperatures	1
1.3 Hydrostatic equation	3
1.4 Adiabatic lapse rate	4
1.5 Sandström's theorem	5
Problems	7
2 A radiative equilibrium model	9
2.1 Black-body radiation	9
2.2 Absorption and emission	10
2.3 Radiative equilibrium in a grey atmosphere	12
2.4 Radiative time constants	15
2.5 The greenhouse effect	15
Problems	17
3 Thermodynamics	19
3.1 Entropy of dry air	19
3.2 Vertical motion of saturated air	20
3.3 The tephigram	22
3.4 Total potential energy of an air column	24
3.5 Available potential energy	24
3.6 Zonal and eddy energy	29
Problems	30

4 More complex radiation transfer	39
4.1 Solar radiation: its modification by scattering	39
4.2 Absorption of solar radiation by ozone	40
4.3 Absorption by single lines	41
4.4 Transmission of an atmospheric path	44
4.5 The integral equation of transfer	45
4.6 Integration over frequency	47
4.7 Heating rate due to radiative processes	48
4.8 Cooling by carbon dioxide emission from upper stratosphere and lower mesosphere	48
4.9 Band models	49
4.10 Continuum absorption	50
4.11 Global radiation budget	50
Problems	52
5 The middle and upper atmospheres	58
5.1 Temperature structure	58
5.2 Diffusive separation	60
5.3 The escape of hydrogen	61
5.4 The energy balance of the thermosphere	65
5.5 The photodissociation of oxygen	66
5.6 Photochemical processes	67
5.7 Breakdown of thermodynamic equilibrium	72
Problems	78
6 Clouds	82
6.1 Cloud formation	82
6.2 The growth of cloud particles	83
6.3 The radiative properties of clouds	84
6.4 Radiative transfer in clouds	86
6.5 Cloud radiation feedback	88
Problems	89
7 Dynamics	93
7.1 The material derivative	93
7.2 Equations of motion	94
7.3 The geostrophic approximation	97
7.4 Cyclostrophic motion	98
7.5 Surfaces of constant pressure	99
7.6 The thermal wind equation	100

7.7	The equation of continuity	101
	Problems	102
8	Atmospheric waves	110
8.1	Introduction	110
8.2	Sound waves	110
8.3	Gravity waves	111
8.4	Rossby waves	116
8.5	The vorticity equation	118
8.6	Three-dimensional Rossby-type waves	120
	Problems	122
9	Turbulence	131
9.1	The Reynolds number	131
9.2	Reynolds stresses	132
9.3	Ekman's solution	134
9.4	The mixing-length hypothesis	136
9.5	Ekman pumping	137
9.6	The spectrum of atmospheric turbulence	138
	Problems	141
10	The general circulation	145
10.1	Laboratory experiments	145
10.2	A symmetric circulation	147
10.3	Inertial instability	152
10.4	Barotropic instability	153
10.5	Baroclinic instability	154
10.6	Sloping convection	158
10.7	Energy transport	159
10.8	Transport of angular momentum	161
10.9	The general circulation of the middle atmosphere	162
	Problems	168
11	Numerical modelling	173
11.1	A barotropic model	173
11.2	Baroclinic models	174
11.3	Primitive equation models	176
11.4	Parametrizations	177
11.5	Models for weather forecasting	177
11.6	Inclusion of orography	180

11.7	Radiation transfer	180
11.8	Sub grid scale processes	185
11.9	Moist processes and clouds	186
11.10	Convection	187
11.11	Transfer across the surface	189
11.12	Forecast model skill	190
11.13	Other models	190
	Problems	192
12	Global observation	198
12.1	What observations are required?	198
12.2	In situ observations	199
12.3	Remote sensing	199
12.4	Radar and lidar observations from the surface	200
12.5	Remote sounding from satellites	201
12.6	Remote sounding of atmospheric temperature: theory	204
12.7	Instruments for remote temperature sounding	210
12.8	Remote measurements of composition	215
12.9	Other remote sounding observations from space	220
12.10	Observations from remote platforms	221
12.11	Achieving global coverage	221
	Problems	224
13	Chaos and atmospheric predictability	229
13.1	Chaotic behaviour	229
13.2	The Lorenz attractor	230
13.3	Model predictability	231
13.4	Variations in forecast skill	234
13.5	Ensemble forecasting	234
13.6	Model improvements	236
13.7	Jupiter's Great Red Spot	238
13.8	Different kinds of predictability	238
	Problems	240
14	Climate and climate change	242
14.1	The climate system	242
14.2	Variations of climate over the past millennium	243
14.3	The ice ages	246
14.4	Influence of the ocean boundary	248
14.5	Human influences on climate	250

14.6	The enhanced greenhouse effect	255
14.7	Feedback processes	260
14.8	Modelling climate change	262
14.9	Observations of climate	265
14.10	Dynamical response to external forcing	266
14.11	The impacts of climate change	269
	Problems	270
	Appendices	275
1	Some useful physical constants and data on dry air	275
2	Properties of water vapour	276
3	Atmospheric composition	277
4	Relation of geopotential to geometric height	278
5	Model atmospheres (0–105 km)	278
6	Mean reference atmosphere (110–500 km)	287
7	The Planck function	287
8	Solar radiation	289
9	Absorption by ozone in the ultraviolet	290
10	Spectral band information	290
