ATMOSPHERIC DIFFUSION

The Dispersion of Windborne Material
from
Industrial and other Sources

2nd Edition

F. PASQUILL, D.Sc.

CONTENTS

PREFACE	v
NOTATION AND SYMBOLS	ix
1. Introduction and Brief Outline	1
2. The Properties of Atmospheric Turbulence	8
2.1 Essentials in the statistical description of turbulent flow	8
2.2 The vertical distribution of wind and temperature in the planetary boundary layer	23
2.3 Thermal stratification and the maintenance of turbulent kinetic energy	35
2.4 Spectral representation—its significance and limitations	40
2.5 The small-scale structure of atmospheric turbulence	45
2.6 The overall shape and scale of the spectrum	54
2.7 Dependence of wind fluctuation statistics on sampling duration and averaging time	64
2.8 The magnitude of the wind fluctuations	71
2.9 Lagrangian properties	86
2.10 Large-scale properties	93
3. Theoretical Treatments of the Diffusion of Material	101
3.1 Eddy diffusivity and the gradient-transfer approach	101
3.2 Solutions of the equations of diffusion	108
3.3 Similarity theory applied to diffusion	116
3.4 Statistical theory of dispersion from a continuous source	123
3.5 The form of the Lagrangian correlogram and spectrum	130
3.6 The expanding cluster	138
3.7 Diffusion of falling particles	145
3.8 The fluctuation of concentration	152
3.9 The effect of wind shear on horizontal spread	156

4. Experimental Studies of the Basic Features of Atmospheric Diffusion	166
4.1 Principles of technique and analysis	166
4.2 The form of the cross-wind distribution at short range from a maintained point source	173
4.3 The magnitude of the cross-wind spread at short range from a maintained point source	179
4.4 The explicit relation between cross-wind spread and the statistics of the wind fluctuations	185
4.5 Implications regarding the Lagrangian-Eulerian relationship	193
4.6 Vertical diffusion at short range	198
4.7 The growth of clusters of particles	211
4.8 Diffusion on a large scale	223
4.9 Recapitulation	237
5. The Distribution of Windborne Material from Real Sources	240
5.1 The rise of hot effluent	240
5.2 Deposition of airborne material	252
5.3 The distribution of gaseous effluent from industrial stacks	269
5.4 The effects of surface features	287
5.5 Pollution in urban areas	300
5.6 The long-range transport of sulphur pollution	311
5.7 The travel and deposition of radioactive material	317
5.8 Agricultural, botanical and related interests	323
6. The Estimation of Diffusion and Air Pollution from Meteorological Data	329
6.1 Qualitative features of diffusion and their variation with weather conditions	330
6.2 The special meteorological factors and their significance in diffusion calculations	334
6.3 Functional forms for the distribution of material	346
6.4 The evolution of idealized short-range formulae	353
6.5 The basis for more general estimates of dispersion	360
6.6 Development of practical systems for calculating the concentration pattern from a single source	365
6.7 Mathematical modelling for multiple sources	380
6.8 Estimating air pollution from routine meteorological data	391
6.9 Limitations and uncertainties in 'meteorological' estimates of pollution	395
