Contents

Preface	ix
1. Introduction	
Text	1
2. Basic Set of Equations	
2.1 Conservation of Mass	3
2.2 Conservation of Heat	5
2.3 Conservation of Motion	13
2.4 Conservation of Water	17
2.5 Conservation of Other Gaseous and Aerosol Materials	18
2.6 Summary	19
Notes	21
Bibliography	21
3. Simplification of the Basic Equations	
3.1 Conservation of Mass	23
3.2 Conservation of Heat	29
3.3 Conservation of Motion	30
3.4 Conservation of Water and Other Gaseous and Aerosol Contaminants	40
Notes	41
4. Averaging the Conservation Relations	
4.1 Definition of Averages	42
4.2 Vorticity Equation	49
4.3 Diagnostic Equation for Nonhydrostatic Pressure	52
4.4 Scaled Pressure Form	54

4.5	Summary	56
	Appendix	56
	Notes	58
	Bibliography	59
5.	Types of Models	
5.1	Physical Models	60
5.2	Linear Models	66
	Notes	101
	Useful References	101
6.	Coordinate Transformations	
6.1	Tensor Analysis	102
6.2	Generalized Vertical Coordinate	111
6.3	The Hydrostatic Assumption	118
6.4	Summary	125
	Notes	126
	Bibliography	127
7.	Parameterization—Averaged Subgrid Scale Fluxes	
7.1	Basic Terms	130
7.2	Gaussian Plume Model	135
7.3	Similarity Theory	140
7.4	Planetary Boundary Layer Parameterization	151
7.5	Use of a Boundary Layer Parameterization to Estimate Transport and Diffusion	173
	Notes	183
	Bibliography	186
8.	Averaged Radiation Flux Divergence	
8.1	Introduction	187
8.2	Basic Concepts	187
8.3	Longwave Radiative Flux	191
8.4	Shortwave Radiative Flux	210
	Notes	224
	Bibliography	225
9.	Parameterization of Moist Thermodynamic Processes	
9.1	Introduction	227
9.2	The Parameterization of the Influence of Phase Changes of Water in a Convectively Stable Atmosphere	229
9.3	The Parameterization of the Influences of Phase Changes of Water in a Convectively Unstable Atmosphere	241
	Notes	268
	Bibliography	270

10. Methods of Solution

10.1 Finite Difference Schemes	272
10.2 Upstream Interpolation Schemes	297
10.3 Finite Element Representation	307
10.4 Diagnostic Equations	321
10.5 Time Splitting	323
10.6 Nonlinear Effects	324
10.7 Summary	331
Notes	331
Bibliography	332

11. Boundary and Initial Conditions

11.1 Grid and Domain Structure	333
11.2 Initialization	349
11.3 Spatial Boundary Conditions	361
Notes	418

12. Model Evaluation

12.1 Evaluation Criteria	421
12.2 Comparison with Analytic Theory	422
12.3 Comparison with Other Numerical Models	430
12.4 Comparison against Different Model Formulations	431
12.5 Calculation of Model Budgets	439
12.6 Comparison with Observations	448
12.7 Availability of Model Logic	453
Notes	453

13. Examples of Mesoscale Models

13.1 Terrain-Induced Mesoscale Systems	456
13.2 Synoptically-Induced Mesoscale Systems	496
Notes	508
Bibliography	508

Appendix A: The Solution of Equations (10-21a), (10-38), and (10-56) with Periodic Boundary Conditions

Text	509
------	-----

Appendix B: Model Summary

I. Groups Active in Prognostic Numerical Mesoscale Modeling in 1982	513
II. Examples of Groups Active in Modeling Whose Work Is of Direct Relevance to Mesoscale Modeling	534

References	541
