GENERAL INTRODUCTION (pages 3 to 4)

PART I. THERMODYNAMICS AND STATICS OF THE ATMOSPHERE

	PAGES		PAGES
INTRODUCTION.....	7	CHAPTER 2. STATICS OF THE ATMOSPHERE (pages 36-63)	
CHAPTER 1. THERMODYNAMICS OF THE ATMOSPHERE (pages 8-35)			
1.0 The composition of the atmosphere.....	8-15	2.0 The representation of atmospheric scalar fields....	36-41
1.00 Pure dry air. 1.01 The distribution of ozone.		2.00 Equiscalar surfaces. 2.01 Ascendent and gra-	
1.02 Measures of humidity. 1.03 Saturation pres-		dient. 2.02 Homotropy and heterotropy between	
1.04 Maximum water vapor pressure over		two scalars. 2.03 Two-dimensional scalars. 2.04	
curved surfaces and over salt solutions. 1.05 The		Two-dimensional representations of general three-	
distribution of atmospheric water vapor. 1.06 At-		dimensional fields. 2.05 The atmospheric scalar	
mospheric pollution. 1.07 Condensation and crys-		fields. 2.06 Barotropy and piezotropy. 2.07 Auto-	
tallization processes in the atmosphere. 1.08 The		barotropy and accidental barotropy. 2.08 Examples	
processes of precipitation in the atmosphere. 1.09		of barotropy	
Classification of clouds and precipitation		2.1 Gravity and gravity potential.....	41-42
1.1 The equation of state for an air particle.....	15-18	2.2 The principles of statics.....	42-45
1.10 The variables of state. 1.11 The general equa-		2.20 The fundamental statical equations. 2.21 Equi-	
tion of state. 1.12 Special equations of state. 1.13		librium relations between the atmospheric fields. 2.22	
The connection between vapor pressure and mixing		The two fundamental statical problems. 2.23 The	
ratio. 1.14 The equation of state for unsaturated		statical equation in "reference variables." 2.24 Con-	
air. 1.15 The virtual temperature		traction and expansion of isobaric layers	
1.2 The heat supply to air particles.....	18-21	2.3 Simple examples of equilibrium.....	45-47
1.20 The first principle of thermodynamics. 1.21		2.4 Quasi-static discussion of some thermodynamical	
Classification of the variations of state. 1.22 Adia-		problems.....	47-51
batic variations of state for ideal gases. 1.23 The		2.40 Molecular heat conduction in the atmosphere.	
potential temperature		2.41 Isobaric mixing processes in the atmosphere.	
1.3 Entropy and the second principle of thermody-		2.42 Anisobaric mixing. 2.43 The unsaturated varia-	
namics.....	21-25	tion of state during adiabatic vertical motions. 2.44	
1.30 The Carnot cycle for an ideal gas. 1.31 Carnot's		The saturated variation of state during adiabatic	
theorem. 1.32 The general reversible cycle of an ideal		vertical motions	
gas. Entropy. 1.33 The entropy of dry air. 1.34		2.5 Static stability and instability.....	51-63
The entropy of water in different phases. 1.35 The		2.50 General criteria of static stability and instability.	
entropy of moist air containing water and ice. 1.36		2.51 Stability and instability of unsaturated air.	
Entropy and irreversible variations of state		2.52 Examples of stability and instability of dry air.	
1.4 Variations of state of moist air.....	25-27	2.53 Stability of saturated air. 2.54 Practical sta-	
1.40 The unsaturated stage. 1.41 The saturated		bility and instability of moist unsaturated air. 2.55	
stage above zero (the condensation stage). 1.42 The		Influence of large-scale vertical motion on the sta-	
freezing stage. 1.43 The crystallization stage. 1.44		bility of air which remains unsaturated. 2.56 Large-	
Pseudo-adiabatic variations of moist air		scale vertical motion and potential lability. 2.57	
1.5 Thermodynamic diagrams.....	27-31	Creation and destruction of instability in the atmo-	
1.50 General properties of thermodynamic diagrams.		sphere	
1.51 The tephigram of Shaw. 1.52 The aerogram of		LITERATURE CITED IN CHAPTER 2.....	63
Refsdal. 1.53 The temperature-logarithmic pressure		CHAPTER 3. QUASI-STATIC DIAGNOSTICS OF ATMOSPHERIC	
diagrams. 1.54 Practical use of the diagrams		FIELDS (pages 64-84)	
1.6 The saturation potential temperature.....	31-33	3.0 The aerological data.....	64-65
LITERATURE CITED IN CHAPTER 1.....	33-35	3.1 Hydrostatical tables and their practical application	65-69
		3.10 The fundamental statical tables. 3.11 De-	
		termination of dynamic heights corresponding to	

	PAGES	PAGES
given pressures. 3-12 Determination of pressures corresponding to given dynamic heights		
3-2 The accuracy attainable in computed aerological data.....	69-71	
3-3 Graphical methods of solving statical problems. 71-77		
3-30 Graphical methods of height determination.		
3-31 The graphical-numerical method of Väisälä.		
3-32 Application of Väisälä's method to a real ascent curve. 3-33 The S_p - Φ_p -diagram of Bellamy. 3-34 Application of the pastagram to a real ascent curve. 3-35 Application of Bellamy's slide rule. 3-36 Determination of energy and lapse rates in aerological diagrams		
3-4 Synoptic representation of present and future atmospheric fields.....	77-83	
3-40 The constant-pressure representation of the pressure field: I. The 10db map. 3-41 The constant-pressure representation of the pressure field: II. The upper-air maps. 3-42 Representation of isotherms and isosteres in standard isobaric surfaces. 3-43 The density field and its application. 3-44 Anohypse analysis. 3-45 Representations in isentropic surfaces. 3-46 Vertical cross sections. 3-47 Vertical time cross sections (isopleth diagrams)		
LITERATURE CITED IN CHAPTER 3.....	83-84	
CHAPTER 4. RADIATION PROCESSES IN THE ATMOSPHERE (pages 85-119)		
4-0 The physical laws of radiation.....	85-88	
4-00 Kirchhoff's law. 4-01 The laws for black-body radiation. 4-02 Selective radiation. 4-03 The absorption of radiation by gases		
4-1 Survey of the radiation processes in the atmosphere and at the earth's surface.....	88-94	
4-10 Atmospheric short-wave absorption. 4-11 Scat-		
tering and diffuse reflection. 4-12 Short-wave absorption due to liquid water in the atmosphere. 4-13 Atmospheric long-wave absorption and emission. 4-14 Long-wave absorption in, and emission from, clouds. 4-15 Reflection and absorption by the ground. 4-16 Reflection and absorption by the ocean		
4-2 The equations of radiative transfer.....	94-98	
4-20 Schwarzschild's equations. 4-21 Separate treatment of short-wave and long-wave radiation. 4-22 The semi-gray and the selective atmosphere. 4-23 Radiative heating and cooling. Radiative equilibrium. 4-24 Brunt's equation for long-wave radiative transfer		
4-3 The problem of radiative balance.....	98-102	
4-30 Radiative balance of the ground. 4-31 Radiative balance of the mean stratosphere. 4-32 Radiative balance of the troposphere. 4-33 Computed radiative heat loss in the cloud-free troposphere. 4-34 The heat balance of clouds		
4-4 Heat transfers between earth and atmosphere... 102-110		
4-40 The diurnal temperature variations of the ground and the superjacent air. 4-41 Theoretical discussions of the nocturnal cooling of the ground and the superjacent air. 4-42 The diurnal temperature variation of the ocean surface and the superjacent air. 4-43 The seasonal variation of soil temperature. 4-44 The seasonal variation of lake and ocean temperatures		
4-5 The heat balance of the atmosphere by latitude zones 110-117		
4-50 The incoming short-wave radiation. 4-51 The outgoing terrestrial and atmospheric radiations. 4-52 The terrestrial heat storage. 4-53 The meridional transfer of total heat. 4-54 The meridional transfer of free and latent heat. 4-55 The vertical heat transfer. 4-56 Simpson's radiation maps		
LITERATURE CITED IN CHAPTER 4.....	117-119	

PART II. KINEMATICS OF THE ATMOSPHERE

INTRODUCTION.....	123	
CHAPTER 5. THE VECTOR FIELD (pages 124-161)		
5-0 The systems of co-ordinates.....	124-128	
5-00 Positive direction and positive rotation. 5-01 Rectangular Cartesian co-ordinates. 5-02 The general curvilinear co-ordinates. 5-03 Orthogonal curvilinear co-ordinates. 5-04 Cylindrical co-ordinates (ρ, ψ, z). 5-05 Spherical (polar) co-ordinates (r, λ, φ)		
5-1 The geographical maps used in meteorology... 128-133		
5-10 Conformal and equivalent maps. 5-11 The choice of maps in meteorology. 5-12 Mercator's projection for equatorial regions. 5-13 Lambert's conical projection for temperate regions. 5-14 Stereographic projection for polar regions. 5-15 The selection of scales. 5-16 The influence of the distortion of the maps		
5-2 Vector algebra.....	133-138	
5-20 The vector notations. 5-21 Vector addition and subtraction. 5-22 Multiplication of scalar and vector. 5-23 Decomposition of vectors. Unit vectors. 5-24 Scalar multiplication of two vectors. 5-25 Vector multiplication of two vectors. 5-26 The triple scalar product. 5-27 The triple vector product. 5-28 The use of curvilinear unit vectors		
5-3 Differentiations and integrations of a vector with respect to a parameter. The kinematic variables.....	138-142	
5-30 Differentiation and integration of a vector. 5-31 Differentiation of the position vector. 5-32 Velocity and acceleration of a material particle. 5-33 Absolute		

PAGES	PAGES
and relative velocity and acceleration. 5-34 Determination of the trajectory	
5-4 Spatial variations in scalar and vector fields. 142-149	
5-40 The ascendent $\nabla\alpha$. 5-41 Spatial variation of a vector. 5-42 The divergence $\nabla\cdot\mathbf{v}$. (5-420 The geometric meaning of the divergence. 5-421 The divergence of curved and diverging fields. 5-422 A general expression of the divergence. 5-423 Divergence in cylindrical and spherical co-ordinates.)	
5-43 The vorticity (curl) of a vector. (5-430 The geometric meaning of the vorticity. 5-431 The vorticity of curved and diverging fields. 5-432 A general expression of the vorticity. 5-433 Vorticity in cylindrical and spherical co-ordinates.)	
5-44 The pure deformation. 5-45 The potential and the rotational part of the linear vector field. 5-46 Rectilinear vector lines in a general linear vector field	
5-5 Differential vector operations. 150-152	
5-50 Ascendent, divergence, and vorticity. 5-51 The direct vector line derivative. 5-52 The conjugate vector line derivative. 5-53 Relations between the vector line derivatives. 5-54 Vector line derivatives in general co-ordinates. 5-55 Operations of the second order	
5-6 Line integrals and surface integrals of a vector. 152-156	
5-60 Procession and circulation integrals. 5-61 Procession and circulation of an ascendent. 5-62 Transport and export integrals. 5-63 Gauss' theorem and the divergence. 5-64 Stokes' theorem and the vorticity	
5-7 Representations of the vector field. Different types of vector. 156-159	
5-70 Component representation of a vector field. 5-71 Representation by vector lines and intensity surfaces. 5-72 Representation by vector tubes and intensity surfaces or surfaces of equal transport. 5-73 The ascendent and the vector with constant intensity. 5-74 The solenoidal vector. 5-75 The complex lamellar vector. 5-76 Representations of the general vector	
5-8 The surface of discontinuity. 159-161	
5-80 Discontinuities in scalar and vector fields. 5-81 The surface divergence. 5-82 The surface vorticity	
LITERATURE CITED IN CHAPTER 5. 161	
CHAPTER 6. THE PRINCIPLES OF KINEMATICS AND THE KINEMATIC PROPERTIES OF SIMPLE MOTIONS (pages 162-195)	
6-0 The method of Lagrange and the individual time derivative. 162-166	
6-00 The motion of a fluid. Co-ordinates of numeration. 6-01 The partial derivatives of the position vector. 6-02 The equation of continuity. 6-03 The fields of velocity and acceleration. 6-04 The individual and the local time derivative. 6-05 Time derivatives in a moving system of co-ordinates	
6-1 The Eulerian method. 166-169	
6-10 Determination of the fields. The equation of continuity. 6-11 Determination of the trajectories. 6-12 Advantages of the Eulerian method	
6-2 Procession and circulation integrals in the field of motion. 169-171	
6-20 Local differentiation of the circulation along a geometric curve. Local conservation of vorticity. 6-21 Individual differentiation of the circulation of a physical curve. 6-22 Individual conservation of circulation and vorticity	
6-3 The surface of discontinuity in the velocity field. 171-175	
6-30 The solenoidal boundary condition for the velocity. 6-31 The kinematic boundary conditions. 6-32 Other boundary conditions. 6-33 Cartesian form of the boundary conditions. 6-34 The motion of a front on a resting map. 6-35 The motion of a front on a moving map	
6-4 The kinematics of steady circulations. 175-178	
6-40 Kinematical description of the steady circular vortex. 6-41 The distribution of vorticity in the circular vortex. 6-42 The circulation of an arbitrary curve in the circular vortex. 6-43 The barotropic circular vortex. 6-44 A steady circulation in a rectangular vessel. 6-45 Circulations in toroidal vessels	
6-5 The kinematics of two-dimensional nonsteady circulations and of standing oscillations. 178-180	
6-50 Nonsteady motions in a rectangular vessel. 6-51 Cellular and noncellular oscillations. 6-52 The trajectories in the standing oscillation. 6-53 A more general standing oscillation	
6-6 The kinematics of simple progressive waves. 180-185	
6-60 Standing oscillations and progressive waves. 6-61 Characteristic properties of wave motions. 6-62 The trajectories in the progressive wave. 6-63 Comparison between standing oscillations and progressive waves. 6-64 Relative streamlines in waves with finite amplitudes. 6-65 The trajectories in waves with finite amplitudes	
6-7 The kinematics of more general wave motions. 185-191	
6-70 The simplest three-dimensional wave. 6-71 Composition of a translation and a stability wave. 6-72 The trajectories in the motion composed of a translation and a stability wave of small amplitude. 6-73 The trajectories in the motion composed of a translation and a finite stability wave. 6-74 Composition of a translation and an instability wave. 6-75 Composition of a shearing motion and a wave motion. 6-76 Stability and instability waves with arbitrary profiles	

	PAGES		PAGES
6·8 The kinematics of the atmosphere.....	191-195	7·4 Application of graphical mathematics to two-dimensional vector fields.....	210-213
6·80 Indirect kinematical determination of vertical motion. 6·81 Indirect thermodynamical determination of vertical motion		7·40 Graphical algebra with two-dimensional vectors.	
LITERATURE CITED IN CHAPTER 6.....	195	7·41 Construction of curves for equal transport. 7·42 Construction of the ascendent field. 7·43 Construction of the fields of divergence and vorticity. 7·44 Construction of the fields for the vector line derivatives. 7·45 Calculation of the vertical component of a three-dimensional solenoidal vector	
CHAPTER 7. TWO-DIMENSIONAL KINEMATICAL METHODS AND THEIR APPLICATION TO WEATHER PROGNOSIS (pages 196-228)		7·5 Differentiation and integration of variable fields with respect to time.....	213-215
7·0 The drawing of two-dimensional scalar and vector fields	196-200	7·50 Local differentiations of scalar and vector fields.	
7·00 Construction of a scalar field. 7·01 The drawing of the lines of discontinuity. 7·02 Representations of the vector field. 7·03 Lines of discontinuity in a vector field. 7·04 Final smoothing of the fields. 7·05 The representation of atmospheric fields		7·51 Individual time differentiation of scalars and vectors. 7·52 Time derivatives of higher order. 7·53 Local time integration. 7·54 Determination of trajectories and individual time integration	
7·1 Zero points in the two-dimensional vector fields..	200-204	7·6 Extrapolation of variable fields.....	215-220
7·10 Differential equation of the vector lines near a zero point. 7·11 Centers of divergence, rotation, and deformation. 7·12 Straight vector lines. 7·13 The linear vector field with two straight vector lines. 7·14 Nonexistence of real straight vector lines. 7·15 The different types of zero point. 7·16 The effect of a translation on a zero point in the velocity field		7·60 The methods of local extrapolation. 7·61 Lagrangian and semi-Lagrangian extrapolation. 7·62 General characteristics of the synoptic extrapolation method. 7·63 α -velocity and α -acceleration. 7·64 The isobar velocity. 7·65 The isallobar velocity. 7·66 The trough and wedge velocity. 7·67 The "velocity" of pressure centers. 7·68 The front velocity. 7·69 Pressure variations in moving systems	
7·2 Graphical algebra of scalar fields.....	204-206	7·7 Extrapolation of conservative fields. Frontogenesis and frontolysis.....	220-227
7·20 Discontinuous and continuous method. 7·21 Graphical algebra with one variable. 7·22 Graphical algebra with two variables. Addition and subtraction. 7·23 Graphical multiplication and division		7·70 Extrapolation of a conservative two-dimensional field. 7·71 Permanent linear and two-dimensional field of motion. 7·72 Permanent and nonlinear two-dimensional field of motion. 7·73 Extrapolation of a three-dimensional conservative field. 7·74 Extrapolation of nonconservative fields. 7·75 Frontogenesis and frontolysis in the atmosphere	
7·3 Spatial differentiations and integrations of scalar fields	206-209	LITERATURE CITED IN CHAPTER 7.....	227-228
7·30 Angular and linear differentiation. 7·31 Linear integration. 7·32 Other differential and integral operations of the first order. 7·33 Differential operations of higher order. Curvature and divergence of curve systems			

PART III. HYDRODYNAMICS OF THE ATMOSPHERE

INTRODUCTION.....	231-232	8·3 The equation of motion.....	241-247
CHAPTER 8. THE ATMOSPHERIC EQUATIONS OF MOTION AND THE THEOREMS OF CIRCULATION (pages 233-268)		8·30 The Lagrangian equations. 8·31 The Eulerian equations. 8·32 The Eulerian equations in general co-ordinates. 8·33 The Eulerian equations in cylindrical co-ordinates. 8·34 The Eulerian equations in spherical co-ordinates. 8·35 The systems of co-ordinates in dynamic meteorology. 8·36 The boundary conditions. 8·37 Classic hydrodynamics	
8·0 The apparent forces of inertia.....	233-235	8·4 The equations of state and energy.....	247-249
8·1 The external forces.....	235-238	8·40 The Lagrangian equation of state. 8·41 Eulerian form of the simplified equation of state. The gas equation. 8·42 Pure and physical hydrodynamics. 8·43 The energy equations	
8·10 The force of attraction and gravity. 8·11 Absolute and relative equilibrium. 8·12 Perturbations of relative equilibrium. 8·13 Combined influence of gravity and deviating force		8·5 Position of characteristic surfaces.....	249-253
8·2 Internal forces. Pressure and tension.....	238-241	8·50 The two Eulerian forms of the equation of motion. 8·51 The equations of level surfaces and	
8·20 The six components of stress. 8·21 Pressure and frictional stresses. 8·22 The pressure force and the force of friction. 8·23 The work of the internal forces. 8·24 Discontinuous motion and boundary conditions			

PAGES	PAGES
isobaric surfaces. 8-52 The inclination of the isobaric surfaces. 8-53 Surfaces of discontinuity. 8-54 Integral formulas for barometric height measurement and for determination of pressure at given heights. 8-55 The errors introduced by the quasi-static method	9-21 Thermally bound circulation of moist air. 9-22 The thermodynamic circulation machine of a frictionless fluid. 9-23 Heat transport in a general circulation machine. 9-24 The regulating effect of friction
8-6 The quasi-static equations in the (x, y, p) system. 253-254	9-3 The formation of two-dimensional oscillations and circulations. 282-287
8-7 The circulation theorems of V. Bjerknes in primitive or diagnostic forms. 254-259	9-30 Oscillations and circulations in a special, accidentally barotropic fluid. 9-31 Dynamical discussion of the equation of frequency. 9-32 Gravity oscillations in stable, and gravity circulations in unstable, fluids. 9-33 The "principle of selection" in a statically unstable fluid. 9-34 Gravity oscillations and circulations in fluids which are partly stable and partly unstable
8-70 Höiland's form of the circulation theorems.	
8-71 The solenoid form of V. Bjerknes' circulation theorems. 8-72 Other forms of the pressure-circulation theorem. 8-73 The circulation theorems for special curves. 8-74 The vorticity theorems. 8-75 Special forms of the vorticity theorems	9-4 Dynamic and thermodynamic properties of two-dimensional circulations. 287-290
8-8 V. Bjerknes' circulation theorems in developed or prognostic forms. 259-261	9-40 A special two-dimensional circulation. 9-41 Instability circulations in viscous fluids. 9-42 Three-dimensional circulations
8-80 The prognostic theorems of circulation and vorticity. 8-81 Formation and conservation of absolute circulation and vorticity. 8-82 Variation of relative circulation	9-5 Circulations in moist air. 290-294
8-9 Discussion of the equation of energy. 261-267	9-50 Instability circulations in largely unsaturated or largely saturated air. 9-51 Conditionally labile circulations. 9-52 Application to the atmosphere
8-90 The thermodynamical theorem of circulation.	
8-91 The thermodynamical-dynamical theorem of circulation. 8-92 Sandström's theorem of circulation.	9-6 Rotational instability or stability of the circular vortex 294-298
8-93 General energy transformations of a fluid system. 8-94 Special energy transformations of a fluid system. 8-95 Individual changes of temperature.	9-60 The equations of motion of the steady circular vortex. 9-61 The rotational stability criteria of the circular vortex without external forces. 9-62 Special criteria of rotational stability. 9-63 Symmetric inertial oscillation in simple toroidal vessels. 9-64 More general rotational oscillations
8-96 Individual changes of temperature produced by vertical motions. 8-97 Local changes of temperature.	
8-98 Local changes in the isobaric temperature and in the thickness of isobaric layers. 8-99 Thermal determination of the vertical velocity	9-7 Rotational and static stability. 298-307
LITERATURE CITED IN CHAPTER 8. 267-268	9-70 A stability criterion for the general circular vortex. 9-71 The stability criteria and the frequency equation for the barotropic vortex. 9-72 The stability criteria for the baroclinic vortex. 9-73 Rotational stability and instability in the atmosphere considered as a baroclinic vortex. 9-74 Rotational stability and thermal regulation
CHAPTER 9. DISCUSSION OF OSCILLATING AND CIRCULATING MOTIONS (pages 269-312)	9-8 Stability and instability of linear flow 307-311
9-0 Steady motions. 269-272	9-80 Transversal oscillations and circulations in a rectilinear motion. 9-81 The method of permanent motion applied to long waves. 9-82 A deduction of the velocity of sound. 9-83 Höiland's explanation of the instability produced by a finite shearing. 9-84 The general problem of shearing instability
9-00 The equations of motion and of continuity in the steady state. 9-01 Individual variations taking place during steady motions. 9-02 The energy equation in special permanent motions. 9-03 Steady motions in physical hydrodynamics	LITERATURE CITED IN CHAPTER 9. 311-312
9-1 Oscillations and circulations in closed tubes. . . 272-278	CHAPTER 10. MATHEMATICAL DISCUSSION OF WAVE MOTIONS WITH APPLICATION TO THE PROBLEM OF CYCLONES (pages 313-359)
9-10 Tube circulation of an autobarotropic fluid.	
9-11 Oscillations and circulations of a special baroclinic fluid in a tube of constant cross section. 9-12 Oscillations and circulations of a general baroclinic fluid in tubes of constant cross section. 9-13 Active and passive displacements. The limiting frequency. 9-14 Oscillations and circulations in tubes with variable cross sections. 9-15 Oscillations and circulations of saturated air. 9-16 The influence of compressibility	10-0 The method of perturbation. 313-318
9-2 The thermodynamic circulation machine of V. Bjerknes 278-282	10-00 Fundamental motion and perturbation. 10-01 The general equations of perturbation. 10-02 Rectangular Cartesian co-ordinates. 10-03 Cylindrical
9-20 Thermally bound circulations of an ideal gas.	

	PAGES	PAGES
co-ordinates. 10·04 Spherical co-ordinates. 10·05 Relative equilibrium and the circular vortex. 10·06 The principle of superposition. Stability and in- stability		
10·1 Differential equations for simple atmospheric waves 318-324		
10·10 The equations for a general fundamental state. 10·11 Special fundamental states. 10·12 Margules' formula in a special case. 10·13 The equations of perturbation for an isothermal fundamental motion with polytropic variations of state. 10·14 Simple wave solutions. Individual and local period. 10·15 The fundamental differential equations		
10·2 Gravity waves on a nonrotating earth. 324-329		
10·20 Surface waves in one homogeneous and in- compressible layer. 10·21 Internal waves in two homogeneous and incompressible layers. 10·22 Ex- ternal and internal waves in two layers with free surface. 10·23 Elastic waves. 10·24 Waves in a nonautobarotropic isothermal fluid. 10·25 Waves in an isothermal fluid with free surface. 10·26 Waves in two isothermal layers		
10·3 Instability waves produced by shearing motion .329-336		
10·30 The shearing instability. 10·31 Simultaneous action of shearing instability and static stability. 10·32 Application to "billow clouds." 10·33 The kinematics of stability waves when a shearing exists. 10·34 The kinematics of instability waves. 10·35 Composition of instability wave and translation. 10·36 Dynamic instability of more general fluid media		
10·4 Inertial waves on the rotating earth. 336-338		
10·40 Symmetric oscillations and meridional waves. 10·41 Zonal inertial waves in an arbitrary latitude. 10·42 Comparison between rotational and static stability in large-scale motions		
10·5 Simple waves produced by static and rotational stability in a barotropic atmosphere. 338-341		
10·50 Gravitational-rotational waves at the equator in an incompressible and homogeneous atmosphere. 10·51 Gravitational-rotational waves at the pole in an incompressible and homogeneous atmosphere. 10·52 Zonal gravitational-rotational waves in an arbitrary latitude. 10·53 Gravitational-rotational waves at the equator within a stably stratified atmosphere. 10·54 Gravitational-rotational waves at the pole in a stably stratified atmosphere		
10·6 Frontal cyclone formation as a wave problem . 341-350		
10·60 Instability waves at an inclined surface of dis- continuity in nonrotating and rotating fluids. 10·61 Stability and instability of long and short waves. 10·62 The mathematical theory of long frontal waves. 10·63 Velocity and wave length of the long frontal wave. 10·64 General considerations concerning the cyclone wave		
10·7 Theory of long waves in the upper atmosphere. 350-358		
10·70 The fundamental state and the perturbation equations. 10·71 Waves in an autobarotropic fluid. 10·72 Waves in some conditionally barotropic and baroclinic fluids. 10·73 Eady's theory of long waves. 10·74 Other investigations of long waves

CHAPTER 11. DYNAMICAL DISCUSSION OF SIMPLE ATMOSPHERIC FIELDS OF MOTION (pages 360-419)		
11·0 The steady circular vortex. 360-367		
11·00 Barotropic and baroclinic vortices. 11·01 Iso- baric and equipotential surfaces. 11·02 The surface of discontinuity of order zero. 11·03 The isosteric, isothermal, and isentropic surfaces. 11·04 The bal- ance between the fields of motion and temperature. 11·05 Relative positions of characteristic surfaces. 11·06 The horizontal vortex. 11·07 The barotropic cosmic vortex. 11·08 The baroclinic cosmic vortex		
11·1 The gradient wind and the geostrophic wind .367-380		
11·10 The steady horizontal and isobaric motion. 11·11 The gradient wind and the geostrophic wind. 11·12 The geostrophic wind. 11·13 Circular cyclones and anticyclones. 11·14 The gradient wind scales constructed by Gustafson and Amble. 11·15 The practical application of geostrophic and gradient wind. 11·16 The thermal wind. 11·17 Applications of the thermal wind		
11·2 The Margules formula. 380-387		
11·20 Inclination of a surface of discontinuity of order zero. 11·21 The Margules formula. 11·22 Pressure and wind fields at stationary and moving fronts. 11·23 Horizontal and vertical velocities at a front. 11·24 Some remarks about the stability of a front surface. 11·25 Inclination of the surface of discontinuity of order unity		
11·3 Steady horizontal motions. 387-396		
11·30 The general equations for steady horizontal motion. 11·31 Permanent horizontal motions of ir- rotational type ($\Omega_z = \text{constant}$). 11·32 Permanent horizontal motions with constant relative vorticity ($\Omega_z = \text{constant}$). 11·33 Permanent horizontal motions with variable relative vorticity ($\Omega_z = \text{constant}$). 11·34 Influence of the meridional variability in Ω_z on the permanent motions		
11·4 Nonpermanent horizontal and quasi-horizontal motions 396-401		
11·40 Moving fields of invariable structure. 11·41 General equations for nonpermanent horizontal motions. 11·42 Connection between velocity and individual pressure changes. 11·43 Determination of the velocity field by means of the pressure field. 11·44 Practical wind determination according to J. Bjerknes and Palmén		

PAGES	PAGES
11.5 The divergence in quasi-horizontal velocity fields 401-407	Prandtl's theory for the mixing length. 12.17 Lateral mixing. 12.18 "Selective" lateral mixing. 12.19 Investigations of turbulence by statistical methods
11.50 The horizontal divergence expressed by fields of velocity and acceleration. 11.51 Horizontal mass divergence in wave-shaped isobar patterns. 11.52 Horizontal mass divergence within stationary and moving cells of high and low pressure. 11.53 Density advection	12.2 Eddy transfer of atmospheric heat and water vapor 436-446
11.6 Air currents over sloping ground. 407-412	12.20 The coefficients of eddy diffusion. 12.21 The turbulent heat exchange between the atmosphere and the surface of the earth. 12.22 Transformations of air-masses by eddy diffusion. 12.23 Evaporation by eddy diffusion. 12.24 Geographical distribution of evaporation from ocean and land surfaces. 12.25 Ratio between the transfers of caloric and latent heat between ocean and atmosphere. 12.26 Total eddy diffusion heat transfer between ocean and atmosphere. 12.27 Influence of turbulence on formation and dissipation of clouds and fogs
11.7 The quasi-static theory for pressure changes. . 412-417	12.3 Eddy viscosity in the atmosphere. 446-455
11.70 The quasi-static tendency equations. 11.71 The statical-kinematical tendency equation for the relative height. 11.72 The statical-kinematical pressure tendency equation. 11.73 Practical applications of the tendency equation. 11.74 Diagnostic use of the tendency equation	12.30 The "classic" theory for the variation of wind with height. 12.31 The surface resistance and the laminar sub-boundary layer. 12.32 Wind distribution in the surface layer. 12.33 Wind distribution in the frictional layer according to Rossby's theory. 12.34 Eddy viscosity in the free atmosphere. 12.35 The equations of motion near the earth's surface
LITERATURE CITED IN CHAPTER 11. 417-419	12.4 Energy transformations in the atmosphere. . . . 455-460
CHAPTER 12. ATMOSPHERIC TURBULENCE (pages 420-463)	12.40 A simple relation between internal and potential energies in a uniform atmosphere. 12.41 The available potential energy in the atmosphere. 12.42 Concentration and disorganization of atmospheric kinetic energy. 12.43 Dissipation of atmospheric kinetic energy
12.0 The smoothed hydrodynamical equations. . . . 420-425	LITERATURE CITED IN CHAPTER 12. 460-463
12.00 Time-space averages in practical meteorology.	
12.01 Mass-smoothed hydrodynamical equations.	
12.02 Volume-smoothed hydrodynamical equations.	
12.03 Simplified smoothed hydrodynamical equations.	
12.04 Turbulence as a "compensation for smoothing."	
12.05 The eddies in the atmosphere	
12.1 The descriptive theories of turbulence. 425-436	
12.10 The mixing length theory of eddy diffusion.	
12.11 Eddy diffusion of heat in dry air. 12.12 Eddy diffusion of solid particles suspended in the air. 12.13 Eddy diffusion of atmospheric water. 12.14 Eddy diffusion in saturated air. 12.15 Mixing length theories for the eddy diffusion of momentum. 12.16	
PART IV. CLIMATOLOGICAL AND SYNOPTIC MODELS	
INTRODUCTION. 467	
CHAPTER 13. THE AVERAGE FIELDS OF THE ATMOSPHERIC VARIABLES (pages 468-504)	
13.0 The atmosphere as a circular vortex. 468-481	
13.00 The meridional profile of temperature. 13.01 The meridional profile of pressure. 13.02 The meridional profile of mass and $(s, -p)$ -solenoids. 13.03 The meridional profile of zonal geostrophic wind. 13.04 The maintenance of the atmospheric field of temperature. 13.05 The geographical distribution of net radiation. 13.06 Principles of the general circulation. 13.07 The budget of angular momentum in zonal rings	hemispheres. 13.13 Zonal averages of sea-level pressure in the two hemispheres
13.1 The normal fields of temperature and pressure at sea level. 481-484	13.2 The normal three-dimensional fields of temperature and pressure in the northern hemisphere. 484-494
13.10 Normal sea-level isotherms and isobars in the southern hemisphere. 13.11 Normal sea-level isotherms and isobars in the northern hemisphere. 13.12 Zonal averages of sea-level temperature in the two	13.20 The polar vortex. 13.21 Quasi-stationary disturbances superimposed on the polar vortex. 13.22 The monsoons. 13.23 The quasi-permanent subtropical highs. 13.24 The doldrum zone. 13.25 Surface air currents in the equatorial belt. 13.26 Upper-air currents in the equatorial belt
	13.3 Fronts and air-masses of the general circulation. 494-504
	13.30 The fronts of low latitudes. 13.31 The Polar fronts of the northern hemisphere in winter. 13.32 The Arctic fronts of the northern hemisphere. 13.33 The Polar fronts and Trade fronts of the northern hemisphere in summer. 13.34 The fronts of the southern hemisphere. 13.35 Continental influences on the atmosphere. 13.36 Jacobs' maps of net heat and moisture transfers between ocean and atmosphere
	LITERATURE CITED IN CHAPTER 13. 504

CHAPTER 14. PHYSICAL PROPERTIES OF AIR-MASSSES AND FRONTS (pages 505-534)	PAGES
	PAGES
14·0 General properties of air-masses	505-507
14·00 Definition of air-masses and fronts in space and time. 14·01 Horizontal gradients of the characteristic temperatures in air-masses and frontal zones. 14·02 The three methods of classification	
14·1 The "absolute" geographical air-mass classification	507-519
14·10 Characteristics of maritime Tropical air. 14·11 Characteristics of Arctic and Polar air. 14·12 Characteristics of continental Tropical air. 14·13 Local air-mass characteristics at subtropical coast lines with cold sea surface. 14·14 The transparency of the air as an air-mass property	
14·2 The "relative" air-mass classification	519-526
14·20 Warm-mass characteristics. 14·21 Cold-mass characteristics	
14·3 The front models	526-531
14·30 The quasi-stationary front model and the upglide cloud system. 14·31 The warm-front model. 14·32 The cold-front models. 14·33 The occlusion models	
14·4 The occluded-cyclone model	531-533
14·5 The weather type zones of the earth	533-534
LITERATURE CITED IN CHAPTER 14	534
CHAPTER 15. DYNAMICAL ANALYSIS OF CYCLONES AND ANTICYCLONES (pages 535-578)	
15·0 Origin and life cycle of extratropical cyclones	535-550
15·00 The Polar front theory of cyclones. 15·01 The energy transformations in the frontal cyclone. 15·02 Stability analysis of straight baroclinic flow. 15·03 Model of straight westerlies with a quasi-stationary Polar front. 15·04 Theory of cyclogenesis at axis of dilatation east of a col in the westerlies. 15·05 Theory of the coupling of the upper wave with the frontal wave. 15·06 Unstable upper waves. 15·07 The empirical dependence of cyclogenesis on pre-existing jet stream structure. 15·08 Cyclone deepening under an upper "delta"	
15·1 Kinematic properties of frontal cyclones	550-555
15·10 Vertical velocity at frontal surfaces. 15·11 Vertical motion inferred from frontal precipitation. 15·12 The continuous field of vertical motion. 15·13 The distribution in space of horizontal mass divergence	
15·2 Theory of pressure changes in moving cyclones and anticyclones	555-559
15·20 The conditions for displacement of the cyclone in terms of horizontal mass divergence. 15·21 Stable adjustment of pressure tendencies. 15·22 Horizontal	
mass divergence in relation to deepening and filling. 15·23 Pressure changes connected with moving anticyclones	
15·3 Cyclones and anticyclones in their relation to the waves in the westerlies	559-563
15·30 Statistical record of the structure of the moving lows and highs. 15·31 Long waves in the westerlies. 15·32 Interference of long and short waves	
15·4 Tropical disturbances	563-577
15·40 The average state of the tropical troposphere. 15·41 Extratropical fronts reaching the tropical zone. 15·42 The intertropical convergence zone. 15·43 Easterly waves. 15·44 Tropical cyclones. 15·45 Dynamic model of a rotationally symmetric tropical cyclone. 15·46 Phenomena connected with deviations from rotational symmetry in tropical cyclones. 15·47 Disturbances in the upper westerlies overlapping the tropical easterlies. 15·48 Upper disturbances in a regime of deep tropical easterlies. 15·49 The influence of upper tropospheric disturbances on the formation of tropical cyclones	
LITERATURE CITED IN CHAPTER 15	577-578
CHAPTER 16. PERIODIC AND IRREGULAR DISTURBANCES OF THE TROPOSPHERIC MODELS (pages 579-616)	
16·0 General considerations concerning periodic atmospheric perturbations	579-582
16·00 Analysis of periodic oscillations. 16·01 Resonance theory for forced oscillations. 16·02 Correspondence between tides in ocean and atmosphere. 16·03 Proper oscillations of the atmosphere. 16·04 Resonance depths	
16·1 The atmospheric tides	582-588
16·10 The tidal forces. 16·11 Decomposition, resonance, and superposition. 16·12 Empirical facts about the solar and lunar atmospheric tides. 16·13 The three-dimensional picture of the semidiurnal tide. 16·14 The dynamics of the semidiurnal tide. 16·15 The dynamics of the lunar tide	
16·2 Periodic variations in pressure and wind created by thermal influences	588-600
16·20 The diurnal pressure wave as a function of height. 16·21 The diurnal pressure wave over continents and over oceans. 16·22 The global diurnal oscillation. 16·23 Thermal genesis of circulation. 16·24 The land-and-sea breeze. 16·25 The mountain-and-valley winds. 16·26 Cumulus and Cumulonimbus circulations. 16·27 Tornadoes	
16·3 Orographic and frictional modifications of large-scale air currents	600-610
16·30 The leeward vortex. 16·31 Leeward standing waves. 16·32 Foehn and lee waves. 16·33 The corner effect. 16·34 Mistral, bora, Tehuantepec winds, and the like. 16·35 Vertical motion by oro-	

PAGES	PAGES
graphic friction influence. 16·36 Orographic precipitation at mountain ranges	graphic modification of a warm front or a warm-front occlusion
16·4 Local modifications of fronts 610-613	16·5 Representativeness and irrepresentativeness of observations 613-615
16·40 Films of cold air and pseudofronts. 16·41 Masking of cold fronts by cold-air films. 16·42 Masking of warm fronts. 16·43 Dynamic-orographic modification of a cold front. 16·44 Dynamic-orographic	LITERATURE CITED IN CHAPTER 16 615-616

PART V. WEATHER FORECASTING

PAGES	PAGES
INTRODUCTION 619	interpretation of the upper-air station plot. 17·53
CHAPTER 17. SYNOPTIC WEATHER ANALYSIS (pages 620-722)	The analysis of the relative hypsography. 17·54 The analysis of the absolute hypsography. 17·55 Revising the relative hypsography. 17·56 The analysis of the 5db map. 17·57 The analysis of the 3db map
17·0 The evolution of synoptic weather analysis . . . 620-625	17·6 Upper-air analysis: II. Pressure change 696-701
17·00 The evolution of the local method. 17·01 Evolution of the synoptic method through "epignosis."	17·60 The local change in the relative height associated with the diabatic processes. 17·61 The local change in the relative height associated with adiabatic processes: (1) The transisobaric displacement of air. 17·62 The local change in the relative height associated with adiabatic processes: (2) The isobaric displacement of air: "advection." 17·63 Analysis for local change in the relative hypsographies. 17·64 Analysis for advective change in the relative hypsographies. 17·65 Analysis for nonadvective change in the relative hypsographies
17·02 Lempfert and Shaw's investigations of the main air currents and cyclone structure. 17·03 Synthesis of local and synoptic method: the "Bergen school."	17·7 Upper-air analysis: III. Temperature, humidity, and stability 701-708
17·04 The extension of the synoptic method to aerology	17·70 The field of potential temperature. 17·71 The field of absolute and conditional stability. 17·72 The fields of humidity and condensation pressure. 17·73 The fields of equivalent potential temperature. 17·74 The fields of potential stability and instability. 17·75 Analysis of change due to diabatic processes of radiation and precipitation. 17·76 The field of vertical motion
17·1 Meteorological observations 625-642	17·8 Upper-air analysis: IV. Streamlines, isotachs, horizontal divergence, vertical motion, and aerological revision of the composite map 708-719
17·10 Position and density of the observation points. 17·11 Pressure observations. 17·12 Wind observations. 17·13 Temperature observations. 17·14 Humidity observations. 17·15 Observations of the amount and type of precipitation. 17·16 Observations of the amount and the type of clouds. 17·17 Observations of the range of visibility and of present and past weather	17·80 Streamline and isotach analysis. 17·81 The twelve-hour path. 17·82 The trajectory soundings. 17·83 Vertical velocity. 17·84 The quantitative analysis of velocity divergence in the free atmosphere. 17·85 The aerological revision of the composite map. 17·86 The tools for computing the constant absolute vorticity paths
17·2 Transmission, collection, and plotting of the meteorological observations 642-651	LITERATURE CITED IN CHAPTER 17 719-722
17·20 Synoptic reports. 17·21 Composite reports. 17·22 Aerological reports. 17·23 Aircraft weather reports. 17·24 Transmission of the synoptic reports. 17·25 The composite map and the upper-air maps. 17·26 The plotting of the composite observations. 17·27 The plotting of the aerological observations	CHAPTER 18. WEATHER FORECASTING (pages 723-790)
17·3 The general methods of weather map analysis . . 651-654	18·0 Weather prognosis as a mathematical-physical problem 723-726
17·4 The analysis of the composite map 654-681	18·00 The atmospheric equations of motion. 18·01 The boundary conditions. 18·02 The initial state. 18·03 Turbulence and instability phenomena
17·40 The "previous maps" of the analysis. 17·41 The identification of warm air-masses and cold air-masses on the composite maps. 17·42 The identification of Tropical, Arctic, and Polar air on the weather map. 17·43 The determination of precipitation areas and isallobars. 17·44 The sketching of the isobars and fronts. 17·45 The determination of the front types. 17·46 The finishing touch of the analysis. 17·47 Evolution of the weather situation during 10-13 October 1923. 17·48 Routine analysis of the occluded cyclone on 13 October 1923 by means of previous maps. 17·49 The abbreviated or summary composite map analysis	
17·5 Upper-air analysis: I. Pressure and wind 681-696	
17·50 Indirect aerology. 17·51 The analysis for fronts in the constant-pressure map. 17·52 The	

	PAGES		PAGES
18.1 The general principles of practical weather forecasting	726-732	18.4 Prediction of various weather constituents . . .	750-773
18.2 Weather map prognosis: I. Extrapolation methods	732-737	18.40 Objective prediction of a weather constituent.	
18.20 Prognosis of the pressure systems and fronts on the composite map by geometrical extrapolation.		18.41 Predictions of temperature. 18.42 General predictions of hydrometeors. 18.43 Prediction of WM hydrometeors. 18.44 Prediction of showers. 18.45 Quantitative prediction of precipitation. 18.46 Prediction of winds. 18.47 Prediction of ice deposits	
18.21 Prognosis of the relative hypsography by advective-adiabatic extrapolation. 18.22 Extrapolation of the relative hypsography by the assumption of constant absolute vorticity		18.5 The weather forecasts	773-779
18.3 Weather map prognosis: II. The application of the tropospheric models	737-750	18.50 The general forecast. 18.51 The area forecast. 18.52 Special forecasts for marine navigation and fisheries. 18.53 Special forecasts for agriculture, forestry, and water supply. 18.54 Special forecasts for industry. 18.55 The meteorological safety service for aviation	
18.30 Lower troposphere frontogenesis and frontolysis.		18.6 Extended weather forecasts	779-787
18.31 Formation of front waves. 18.32 Development of a front wave into a cyclone. 18.33 Cold-front and warm-front occlusions. 18.34 Degeneration and regeneration of an occlusion. 18.35 Forecasting problems concerned with anticyclones. 18.36 Orographic influences on air currents, air-masses, and fronts. 18.37 Predicting the composite map from the upper-air pressure and temperature fields. 18.38 Prognosis of the relative hypsography by nonadvective and diabatic extrapolation. 18.39 Prognosis of the stability fields		18.60 Synoptic extrapolation for two or three days (the further outlook). 18.61 Extended forecasting based on extrapolation of individual upper long waves. 18.62 Extended forecasting based on five-day mean circulations. 18.63 Extended forecasting based on analogous sequences of weather maps. 18.64 Extended forecasting by means of statistical extrapolation. 18.65 General form of the long-range weather forecast
