CONTENTS

Foreword	
Notations	
Introduction	
1. <i>The Navier-Stokes equations</i>	
Introduction	1
The general equations for compressible flows	1
Incompressible flows	6
Reynolds' number	6
Mathematics and Turbulence	7
Boundary layers	10
Wall laws	12
Conclusion	16
 <i>Part I. Incompressible fluids</i>	
2. <i>Homogeneous Incompressible Turbulence</i>	
Introduction	17
Invariants	18
Fourier modes	20
Statistical turbulence	21
The Kolmogorov law	23
Representation of an isotropic turbulence	25
Direct simulations	25
SubGrid Scale modeling	27
Conclusion	28
3. <i>Reynolds Hypothesis</i>	
Introduction	29
Filters	30
Reynolds stress	32

Reynolds closure hypothesis.....	34
Frame invariance	34
Algebraic subgrid scale model.....	40
Finite Element methods for Smagorinsky's model	41
Numerical results	48
Conclusion	49
4. <i>The $k - \epsilon$ model</i>	
Introduction	51
Definition of the model	52
Justification of the model	53
Determination of the constants	56
boundary conditions.....	58
Summary	62
5. <i>Mathematical analysis and approximation</i>	
Introduction	63
Positivity of k and ϵ	63
Existence of solution.....	66
Numerical methods.....	68
Performances and numerical results	73
<i>Appendix: An existence theorem for the reduced model</i>	<i>79</i>
6. <i>Other models beyond $k - \epsilon$</i>	
Introduction.....	83
Reynolds stress models	85
Invariance and realizability	86
Algebraic stress models.....	87
Nonlinear $k - \epsilon$	88
RNG- $k - \epsilon$ model.....	90

Part II. Compressible fluids

7. <i>Numerical simulation of compressible flows</i>	
Introduction	91
A Finite Volume / Finite Element method	92
A Finite Element SUPG method.....	97
A Finite Difference method: PPM.....	99
Numerical results.....	100

8.	<i>Compressible Reynolds Equations</i>	
	Introduction	103
	The Favre average	104
	Further modeling	110
	Low Reynolds number regions	113
	Summary	116
	<i>Appendix</i> : Two Algebraic and one one-equation models	117
 9.	 <i>Numerical tools for compressible k-epsilon</i>	
	Introduction	121
	Positivity of k and ϵ	122
	Stability of the $k - \epsilon$ system	124
	Numerical algorithms for compressible $k - \epsilon$	125
 10.	 <i>Numerical results and extensions</i>	
	Grid Turbulence	133
	Flow over a flat plate	133
	Flow in a cavity	134
	Flow over a backward step	135
	Flow past an airfoil	135
	Hypersonic compression corner	136
	Axisymmetric flows: Base flow, flow in a centrifuger	137
	<i>Appendix</i> : Axisymmetric Navier-Stokes equations	142

Part III. Convection of Micro-Structures

11.	<i>Mathematical methods for turbulent transport</i>	
	Position of the problem	149
	The probabilistic approach	150
	Propagation of oscillations	151
	Homogenization	152
	Homogenization by multiple scale expansions	157
	Conclusion	162
 12.	 <i>Derivation of a two equations model by multiple scales expansion</i>	
	Position of the problem	163
	Results	164
	Connection with the $k - \epsilon$ model	165
	Cascade of equations	166
	Study of the canonical micro-structure	168
	Higher order terms	170

Averaged equations.....	172
Local isotropy.....	174
Reduction of the model.....	177
Numerical experiments.....	178
References.....	183
Appendix NSC2KE : A Software for Turbulent Flows.....	193
Index.....	195
