## Chapter 1

### A Personal Perspective on the Early Years of General Circulation Modeling at UCLA

*Akio Arakawa*

<b>I. Introduction</b>	<b>1</b>
<b>II. Early History of Numerical Modeling of the Atmosphere</b>	<b>2</b>
A. The Prelude (-1950)	2
B. The "Epoch-Making" First Phase (1950-1960)	6
<b>III. AA's Personal Pre-UCLA History</b>	<b>8</b>
<b>IV. The "Arakawa Jacobian"</b>	<b>13</b>
<b>V. Development of the Mintz-Arakawa Model</b>	<b>18</b>
<b>VI. Second Phase of Numerical Modeling of the Atmosphere and the Evolution of Different Generations of the UCLA GCM</b>	<b>21</b>
A. The "Magnificent" Second Phase (1960-1990)	21
B. Evolution of Different Generations of the UCLA GCM	22
<b>VII. Vertical Differencing in the UCLA GCM</b>	<b>25</b>
A. Background: Lorenz's Model	25
B. Evolution of Vertical Differencing in the UCLA GCM	27
C. Further Remarks on Vertical Differencing	29

<b>VIII. Horizontal Differencing in the UCLA GCM</b>	<b>30</b>
A. Horizontal Differencing in the Generation I GCM	30
B. Geostrophic Adjustment in Discrete Systems	32
C. Horizontal Differencing in the Generation II GCM	34
D. Zonal Smoothing of Selected Terms Near the Poles	35
E. Horizontal Differencing in the Generation III GCM	36
F. Horizontal Differencing in the Generation IV GCM	36
<b>IX. Formulation of PBL Processes in the UCLA GCM</b>	<b>38</b>
A. Formulation of PBL Processes in the Generation I GCM	38
B. Formulation of PBL Processes in the Generation II GCM	40
C. Background for the PBL Formulations for Later Generations	40
D. Formulation of PBL Processes in the Generation III and IV GCMs	43
<b>X. Formulation of Moist Processes in the UCLA GCM</b>	<b>44</b>
A. Formulation of "Moist Processes" in the Generation I GCM	44
B. Struggle to Find the Physical Basis for Cumulus Parameterization	44
C. Formulation of Moist-Convective Processes in the Generation II GCMs: Cumulus Parameterization by Arakawa (1969)	46
D. Vertical Advection of Moisture in the Generation III and IV GCMs	49
E. Formulation of Moist-Convective Processes in the Generation III and IV GCMs: Cumulus Parameterization by Arakawa and Schubert (1974)	51
<b>XI. Closing Remarks</b>	<b>53</b>
Appendix A	54
Appendix B	58
References	60

## Chapter 2

# A Brief History of Atmospheric General Circulation Modeling

*Paul N. Edwards*

## I. Introduction 67

<b>II. Before 1955: Numerical Weather Prediction and the Prehistory of GCMs</b>	<b>68</b>	
A. Richardson's "Forecast Factory"	68	
B. Computers, Weather, and War in the 1940s		69
C. The Swedish Institute of Meteorology	69	
D. The Joint Numerical Weather Prediction Unit		70
<b>III. 1955–1965: Establishment of General Circulation Modeling</b>	<b>70</b>	
<b>IV. The Geophysical Fluid Dynamics Laboratory</b>		<b>71</b>
A. Manabe and the GFDL General Circulation Modeling Program	71	
B. The GFDL Atmospheric GCMs	72	
<b>V. The UCLA Department of Meteorology</b>		<b>73</b>
A. Mintz and Arakawa	74	
B. Widespread Influence	74	
C. The UCLA Models	74	
<b>VI. The Livermore Atmospheric Model</b>		<b>76</b>
<b>VII. The National Center for Atmospheric Research</b>		<b>77</b>
A. The Kasahara–Washington Models (NCAR 1-3)		77
B. The Community Climate Model	78	
<b>VIII. 1965–1975: Spread of GCMs</b>	<b>79</b>	
A. Modeling Groups Proliferate	79	
B. Modeling Innovations	80	
C. Research on Carbon Dioxide and Climate		81
D. Early Climate Politics and GCMs	81	
<b>IX. 1975–1985: GCMs Mature</b>	<b>82</b>	
A. Computer Power	82	
B. Spread of Modeling Capacity	83	
C. Modeling Innovations and Experiments		83
D. Climate Politics	84	
<b>X. Conclusion</b>	<b>84</b>	
Appendix	85	
References	87	

### Chapter 3

## Clarifying the Dynamics of the General Circulation: Phillips's 1956 Experiment

*John M. Lewis*

### **I. Introduction**      **91**

## Chapter 7

## On the Origin of Cumulus Parameterization for Numerical Prediction Models

*Akira Kasahara*

<b>I. Introduction</b>	<b>199</b>
<b>II. Treatment of Cumulus Convection in Tropical Cyclone Models</b>	<b>200</b>
<b>III. Treatment of Cumulus Convection in General Circulation Models</b>	<b>207</b>
<b>IV. Advent of Arakawa–Schubert Cumulus Parameterization</b>	<b>210</b>
<b>V. Epilogue</b>	<b>217</b>
References	221

## Chapter 8

## Quasi-Equilibrium Thinking

*Kerry Emanuel*

<b>I. Introduction</b>	<b>225</b>
<b>II. Is “Latent Heating” a Useful Concept?</b>	<b>227</b>
A. Dry Convective Turbulence	228
B. Moist Convective Turbulence: The Naïve Approach	230
C. Moist Convective Turbulence: Dotting the i’s	232
D. What Does Equilibrium Convection Look Like?	234
E. Quasi-Equilibrium and Convective Inhibition	237
<b>III. The Physics of Convective Quasi-Equilibrium</b>	<b>238</b>
<b>IV. Nonequilibrium Thinking</b>	<b>240</b>
<b>V. Equilibrium Thinking</b>	<b>247</b>
<b>VI. Summary</b>	<b>253</b>
References	254

## Chapter 9

## Application of Relaxed Arakawa–Schubert Cumulus Parameterization to the NCEP Climate Model: Some Sensitivity Experiments

*Shrinivas Moorthi*

<b>I. Introduction</b>	<b>257</b>
------------------------	------------

<b>II. Modification of Relaxed Arakawa–Schubert</b>	<b>259</b>
A. Reevaporation of the Falling Convective Precipitation	259
B. Some Additional Aspects of RAS	260
<b>III. The New NCEP Climate Model</b>	<b>261</b>
<b>IV. Sensitivity in Semi-Prognostic Test</b>	<b>263</b>
<b>V. Sensitivity Experiments with the Climate Model</b>	<b>265</b>
A. January Case	266
B. July Case	273
C. Sensitivity to $\alpha_i$	280
<b>VI. Summary and Conclusions</b>	<b>280</b>
References	284

## Chapter 10

## Solving Problems with GCMs: General Circulation Models and Their Role in the Climate Modeling Hierarchy

*Michael Ghil and Andrew W. Robertson*

<b>I. Introduction: The Modeling Hierarchy</b>	<b>285</b>
A. Atmospheric Modeling	286
B. Ocean and Coupled Modeling	289
C. Dynamical Systems Theory	290
<b>II. Intraseasonal Oscillations: Their Theory and Simulation</b>	<b>292</b>
A. Extratropical Oscillations: Observations and Theory	292
B. GCM Simulations and Their Validation	296
<b>III. El Niño–Southern Oscillation, from the Devil’s Staircase to Prediction</b>	<b>299</b>
A. ENSO’s Regularity and Irregularity	299
B. The Devil’s Staircase across the Modeling Hierarchy	301
C. Regularity and Prediction	308
<b>IV. Interdecadal Oscillations in the Oceans’ Thermohaline Circulation</b>	<b>311</b>
A. Theory and Simple Models	311
B. Bifurcation Diagrams for GCMs	315
<b>V. Perspectives</b>	<b>317</b>
References	319

## Chapter 11

## Prospects for Development of Medium-Range and Extended-Range Forecasts

*Anthony Hollingsworth*

<b>I. Introduction</b>	<b>327</b>	
<b>II. Methods for the Development of Forecast Models</b>		<b>328</b>
<b>III. Development of the ECMWF Forecasting System</b>		<b>332</b>
<b>IV. Progress in Forecasting</b>	<b>336</b>	
<b>V. ECMWF's Earth System Model and Assimilation System</b>	<b>337</b>	
<b>VI. Opportunities for Development of Medium-Range and Extended-Range Weather Forecasts</b>	<b>339</b>	
A. Opportunities from Developments in Operational Satellites	340	
B. Opportunities from Developments in Research Satellites	342	
C. Opportunities from Developments in Data Assimilation	343	
D. Opportunities from Developments in Forecast Models	344	
E. Opportunities from Developments in Physical Parameterizations	344	
F. Opportunities from Developments in Numerical Methods	345	
G. Opportunities from Increases in Vertical and Horizontal Resolution	345	
H. Opportunities from Development of Diagnostics		347
I. Opportunities from Developments in the Ensemble Prediction System	347	
J. Opportunities from Development of Seasonal Forecasting	348	
K. Opportunities from Developments in Reanalysis		349
<b>VII. A Forward Look</b>	<b>350</b>	
References	351	

## Chapter 12

Climate Services at the Japan Meteorological Agency  
Using a General Circulation Model: Dynamical  
One-Month Prediction*Tatsushi Tokioka*

<b>I. Introduction</b>	<b>355</b>	
<b>II. Procedure of One-Month Prediction</b>	<b>356</b>	
A. Outline of the Model	356	
B. Ensemble Prediction of Time-Averaged Fields		357
C. Probabilistic Prediction	358	
D. Correction of Systematic Model Bias	358	
<b>III. Skill of One-Month Prediction</b>	<b>358</b>	
A. Example of Ensemble Prediction	358	
B. Meaning of Time Integration of the Latter Half Period of a Month	360	
C. Effect of Ensemble Averaging	361	
D. Ensemble Size	362	
E. ACC of Geopotential Height at 500 hPa		363
F. Relationship between ACC and Spread		365
G. Skill of Forecast	367	
<b>IV. Future Improvements</b>	<b>368</b>	
References	370	

## Chapter 13

Numerical Methods: The Arakawa Approach,  
Horizontal Grid, Global, and Limited-Area Modeling*Fedor Mesinger*

<b>I. Introduction: The Arakawa Approach in Numerical Methods</b>	<b>373</b>
<b>II. The Horizontal Grid: Retrospective</b>	<b>376</b>
<b>III. Hexagonal Grids</b>	<b>380</b>
<b>IV. Randall Z Grid and C-Grid-Like B/E Grid Gravity Wave Schemes</b>	<b>385</b>
<b>V. The Eta Model: An Arakawa Approach Story</b>	<b>389</b>
<b>VI. Global Modeling: The Pole Problem</b>	<b>396</b>

<b>VII. The Eta Model: The Next 24 Months and the Limited-Area Modeling Concept</b>	<b>397</b>
<b>VIII. The Eta Coordinate and the Resolution versus Domain Size Trade-Off</b>	<b>401</b>
<b>IX. Hurricane Tracks</b>	<b>406</b>
<b>X. Progress Achieved</b>	<b>408</b>
<b>XI. Example of a Successful Forecast</b>	<b>410</b>
<b>XII. Conclusion</b>	<b>412</b>
References	414

## Chapter 14

### Formulation of Oceanic General Circulation Models

*James C. McWilliams*

<b>I. Introduction</b>	<b>421</b>
<b>II. Dynamics</b>	<b>423</b>
<b>III. Forcing</b>	<b>427</b>
<b>IV. Initial Conditions and Equilibrium</b>	<b>429</b>
<b>V. Numerical Methods</b>	<b>430</b>
<b>VI. Domain Geometry</b>	<b>433</b>
<b>VII. Parameterizations</b>	<b>434</b>
A. Lateral Momentum Transport	436
B. Isopycnal Material Transport	437
C. Surface Boundary Layer and Surface Gravity Waves	439
D. Interior Vertical or Diapycnal Mixing	440
E. Bottom Boundary Layer and Gravity Currents	441
F. Topographic Effects	442
G. Rivers and Marginal Seas	443
<b>VIII. Spatial Resolution</b>	<b>443</b>
<b>IX. Role of the Ocean in Climate System Models</b>	<b>445</b>
<b>X. Conclusion</b>	<b>451</b>
References	452

## Chapter 15

### Climate and Variability in the First Quasi-Equilibrium Tropical Circulation Model

*Ning Zeng, J. David Neelin, Chia Chou, Johnny Wei-Bing Lin, and Hui Su*

<b>I. Introduction</b>	<b>457</b>
------------------------	------------

<b>II. Model Description/Implementation</b>	<b>459</b>
A. Dynamics and Convection	459
B. Cloud Prediction and Radiation	462
C. Land-Surface Model	464
D. Implementation	467
<b>III. Model Results</b>	<b>468</b>
A. Climatology	468
B. How Much Do Departures from Quasi-Equilibrium Affect Climatology?	474
C. Intraseasonal Oscillation	476
D. Interannual Variability	479
<b>IV. Conclusion</b>	<b>484</b>
References	486

## Chapter 16

## Climate Simulation Studies at CCSR

*Akimasa Sumi*

<b>I. Introduction</b>	<b>489</b>
<b>II. Climate Simulations at CCSR</b>	<b>491</b>
A. The CCSR Atmospheric General Circulation Model	491
B. The CCSR Ocean General Circulation Model	492
C. An AMIP Run	492
D. Transient Experiments to Explore the Effects of Increasing CO <sub>2</sub>	495
E. Simulation of the QBO	497
F. Use of Remote Sensing Data with Climate Models	499
<b>III. Climate System Dynamics</b>	<b>499</b>
<b>IV. How Should We Evaluate Our Simulations?</b>	<b>504</b>
<b>V. Conclusion</b>	<b>505</b>
References	507

## Chapter 17

Global Atmospheric Modeling Using a Geodesic Grid  
with an Isentropic Vertical Coordinate*David A. Randall, Ross Heikes, and Todd Ringer*

<b>I. Introduction</b>	<b>509</b>
<b>II. The Z Grid</b>	<b>512</b>

<b>III. A Geodesic Shallow-Water Model Using the Z Grid</b>	<b>516</b>
<b>IV. Semi-Implicit Time Differencing</b>	<b>518</b>
<b>V. Flux-Corrected Transport</b>	<b>518</b>
<b>VI. A Full-Physics Version of the Model Using the Generalized Sigma Coordinate</b>	<b>519</b>
<b>VII. A Three-Dimensional Version of the Model with an Isentropic Vertical Coordinate</b>	<b>519</b>
<b>VIII. Further Analysis of the Isentropic Coordinate</b>	<b>521</b>
<b>IX. Conclusions</b>	<b>535</b>
References	536

## Chapter 18

### A Coupled GCM Pilgrimage: From Climate Catastrophe to ENSO Simulations

*Carlos R. Mechoso, Jin-Yi Yu, and Akio Arakawa*

<b>I. Introduction</b>	<b>539</b>
<b>II. First Journey: From Catastrophe to Cold Bias and Weak Interannual Variability at the Equator</b>	<b>540</b>
A. Model Description	540
B. The Climate Catastrophe	543
C. Overcoming the Catastrophe	543
D. Interannual Variability	545
<b>III. Second Journey: Model Analyses and Revisions</b>	<b>546</b>
A. Systematic Errors of CGCMS	546
B. Factors Contributing to Systematic Errors in the CGCM	552
<b>IV. Third Journey: Realistic Simulation at the Equator</b>	<b>556</b>
A. Model Improvements	556
B. Simulated Interannual Variability after Revisions	557
<b>V. Lessons Learned</b>	<b>561</b>
<b>VI. Present and Future Directions</b>	<b>567</b>
A. The Present	567
B. Code Improvement	568
C. The Next-Generation UCLA AGCM	570
Appendix A—Observational Data	571
Appendix B—Detour: Coupled GCM Forecasts of the 1997–1998 El Niño Event	571
References	573

## Chapter 19

## Representing the Stratocumulus-Topped Boundary Layer in GCMs

*Chin-Hoh Moeng and Bjorn Stevens*

<b>I. Introduction</b>	<b>577</b>
<b>II. Current Understanding of the STBL Regime</b>	<b>578</b>
A. Physical Processes	579
B. Typical Profiles of the Thermodynamical Fields	580
<b>III. Existing STBL Turbulence and Cloud Schemes in GCMs and Their Problems</b>	<b>583</b>
A. Existing Marine Stratocumulus PBL Schemes	583
B. Subtropical Stratocumulus in the CCM3	586
<b>IV. Current Effort in Further Understanding and Developing Parameterizations of the STBL</b>	<b>591</b>
A. LES Results	594
B. Relating $H_f$ to Radiation Flux	597
C. Closure Assumptions	599
<b>V. Conclusion</b>	<b>602</b>
References	602

## Chapter 20

## Cloud System Modeling

*Steven K. Krueger*

<b>I. Introduction</b>	<b>605</b>
A. What Is a Cloud Resolving Model?	605
B. The University of Utah Cloud Resolving Model	607
C. What Is a CRM Good For?	608
D. Cloud Process Studies with the UCLA/UU CRM	610
<b>II. Interactions between Radiation and Convection in Tropical Cloud Clusters</b>	<b>611</b>
<b>III. Thin Midlevel Stratiform (Alto cumulus) Clouds</b>	<b>615</b>
<b>IV. Stratocumulus-to-Trade Cumulus Transition in the Subtropical Marine Boundary Layer</b>	<b>622</b>
A. Decoupling	629
B. Summary	630
<b>V. Enhancement of Surface Fluxes by Tropical Convection</b>	<b>631</b>
<b>VI. Plumes Generated by Arctic Leads</b>	<b>633</b>
<b>VII. Conclusions</b>	<b>637</b>
References	637

## Chapter 21

Using Single-Column Models to Improve  
Cloud-Radiation Parameterizations*Richard C. J. Somerville*

<b>I. Introduction</b>	<b>641</b>	
<b>II. Single-Column Modeling</b>	<b>643</b>	
<b>III. Parameterization Validation and Single-Column Diagnostic Models</b>	<b>646</b>	
A. Diagnostic Models	646	
B. Model Structure	647	
C. Solar Radiation	647	
D. Terrestrial Radiation	648	
E. Horizontal Advection	648	
F. Convection	649	
G. Large-Scale Condensation	649	
H. Cloud Prediction	649	
<b>IV. Model Experiments</b>	<b>650</b>	
A. Long-Term Experiments in the TOGA-COARE Region	650	
B. Short-Term Experiments in the IFA Region		652
<b>V. Conclusion</b>	<b>656</b>	
References	656	

## Chapter 22

## Entropy, the Lorenz Energy Cycle, and Climate

*Donald R. Johnson*

<b>I. Introduction</b>	<b>659</b>	
<b>II. Global Thermodynamics and Monsoonal Circulations</b>		<b>661</b>
<b>III. A Historical Perspective Concerning Entropy and Carathéodory's Statement of the Second Law</b>	<b>666</b>	
<b>IV. The Classical Concept of the Carnot Cycle and the Driftless Climate State</b>	<b>670</b>	
<b>V. The Climate State and the Reversible Component of Total Energy</b>	<b>679</b>	
<b>VI. The Classical Concept of Efficiency in Relation to <math>\langle g(E) \rangle</math> and <math>\langle g(\Delta E_\alpha) \rangle</math></b>	<b>683</b>	
<b>VII. Sources of Entropy in the Modeled Climate State</b>		<b>685</b>
<b>VIII. The Entropy Balance</b>	<b>688</b>	

<b>IX. Energy Balance and Aphysical Sources of Entropy</b>	<b>691</b>
X. The Expected Magnitudes of $\langle \Delta g(\Delta E_\alpha) \rangle$	694
<b>XI. The March of the Seasons and Reversible Isentropic Processes</b>	<b>698</b>
<b>XII. Conclusions and Additional Considerations</b>	<b>707</b>
References	716

## Chapter 23

## Future Development of General Circulation Models

*Akio Arakawa*

<b>I. Introduction: The Beginning of the "Great Challenge" Third Phase</b>	<b>721</b>
<b>II. Choice of Dynamics Equations</b>	<b>727</b>
<b>III. Discretization Problems: Choice of Vertical Grid, Vertical Coordinate, and Horizontal Grid</b>	<b>729</b>
A. Introduction	729
B. Choice of Vertical Grid in the $\sigma$ Coordinate	730
C. Isentropic Vertical Coordinates	734
D. Hybrid $\theta$ - $\sigma$ Coordinates	737
E. Upper and Lower Boundary Conditions	739
F. Choice of Horizontal Grid	739
<b>IV. Discretization Problems: Advection Schemes</b>	<b>740</b>
A. Introduction	740
B. Computational Mode in Discrete Advection Equations	742
C. Semi-Lagrangian Schemes	743
D. An Inherent Difficulty in Discretizing the Advection Equation	746
<b>V. Parameterizations of PBL and Stratiform Cloud Processes and Representation of the Effects of Surface Irregularity</b>	<b>749</b>
A. Various Approaches in PBL Parameterization	749
B. Implementation of PBL Processes in a Vertically Discrete Model	752
C. Unsolved Problems in Modeling Stratiform Clouds	754
D. Processes Associated with Irregular Surface	755
<b>VI. Cumulus Parameterization</b>	<b>756</b>
A. Introduction	756

B. The Objectives of Cumulus Parameterization	757
C. Future Directions	768
<b>VII. Conclusions</b>	<b>770</b>
References	773
Index	781
