Preface x

Foreword xii

Acknowledgements xii

1 The global energy and water cycles	<i>page</i> 1
1.1 The global energy cycle <i>Richard D. Rosen</i>	1
1.2 The global water cycle <i>Taikan Oki</i>	10
2 Global atmospheric models, data assimilation, and applications to the energy and water cycles	30
2.1 Atmospheric models for weather prediction and climate simulations <i>Eugenia Kalnay</i>	30
2.2 Numerical approximations for global atmospheric models <i>David Williamson</i>	33
2.3 Parameterization of subgrid-scale processes <i>Hua-lu Pan</i>	44
2.4 Principles of data assimilation <i>Milija Zupanski and Eugenia Kalnay</i>	48
2.5 Estimation of the global energy and water cycle from global data assimilation <i>Glenn White and Suranjana Saha</i>	55
2.6 Coupled atmosphere–ocean modeling for climate simulation and prediction <i>Ming Ji and Arun Kumar</i>	61
3 Atmospheric processes and their large-scale effects	71
3.1 Radiative effects of clouds and water vapor <i>Grame L. Stephens</i>	71
3.2 Effects of aerosols on clouds and radiation <i>Peter V. Hobbs</i>	91
3.3 Vertical transport processes <i>T. Hauf and S. Brinkop</i>	100
3.4 Precipitating cloud systems <i>Peter Jonas</i>	109
4 Surface and sub-surface processes	124
4.1 Estimating surface precipitation <i>D. Rosenfeld and C. G. Collier</i>	124
4.2 Air–sea fluxes and their estimation <i>Peter K. Taylor and Kristina B. Katsaros</i>	134
4.3 The ocean’s response to the freshwater cycle <i>Raymond W. Schmitt</i>	144
4.4 Physical and physiological feedback constraining evaporation from land surfaces <i>J. L. Monteith</i>	155
4.5 Soil water <i>P. J. Gregory</i>	161
4.6 Surface runoff and subsurface redistribution of water <i>Eric F. Wood</i>	166

5 Use of small-scale models and observational data to investigate coupled processes	183
5.1 Mesoscale field experiments and models <i>Jean-Claude André, Joël Noilhan and Jean-Paul Goutorbe</i>	183
5.2 Cloud-resolving models <i>M. W. Moncrieff and W.-K. Tao</i>	200
6 Examples of the use of GCMs to investigate effects of coupled processes	213
6.1 The interaction of convective and turbulent fluxes in general circulation models <i>David Gregory, Andrew Bushell and Andrew Brown</i>	213
6.2 Soil moisture–precipitation interaction: experience with two land surface schemes in the ECMWF model <i>Anton C. M. Beljaars and Pedro Viterbo</i>	223
7 Continental-scale water budgets	236
7.1 Estimating evaporation-minus-precipitation as a residual of the atmospheric water budget <i>Kevin E. Trenberth and Christian J. Guillemot</i>	236
7.2 Factors determining the partitioning of precipitation into evaporation and runoff <i>P. C. D. Milly</i>	247
7.3 The water budget of a middle latitude continental region: a modeling and observational study <i>Peter Rowntree</i>	254
7.4 Estimating large scale run-off <i>E. Todini and L. Dümenil</i>	265
8 The way forward	282
8.1 Toward an integrated land–atmosphere–ocean hydrology <i>Moustafa T. Chahine</i>	282
<i>Index</i>	287
