PREFACE VII

*Chapter 1. MECHANISMS OF THE GENERAL CIRCULATION
OF THE TROPOSPHERE*

DK 551.513

by H. RIEHL

Introduction	1
The general circulation as simple heat engine	2
Momentum balance	3
Three-cell general circulation	4
Turbulent mixing	5
Model experiments	7
Analytical solutions of the high-tropospheric windfield	11
Polar cap mixing zone	12
Tropical mixing zone	13
Conclusion	14
Mechanisms of momentum exchange	14
Latitudinal momentum transfer	15
Vertical momentum transfer mechanisms	18
Conclusion	20
Mechanisms of heat and moisture exchange	20
Mechanisms of latitudinal heat transport	21
Vertical heat transport	24
Kinetic energy generation and maintenance	27
Extratropical regions	27
Tropical belt	28
The general circulation in wave coordinates	30
Vertical motion and radiation balance	33
Kinetic energy of subtropical jet stream	34
Constant vorticity transport	35
References	36

Chapter 2. PHYSICAL PROCESSES NEAR THE SURFACE OF THE EARTH

DK 551.510.522

by E. L. DEACON

Introduction	39
The energy balance	41
Net radiation income at the surface	41
Heat conduction into the ground	49

Contents

Turbulent transfer	53
Turbulent transfer in relation to the wind profile	56
Effects of stability on the wind profile	57
Heat transfer and the temperature profile	59
Evaporation	65
Potential evapotranspiration or consumptive water use	72
The friction layer and the wind spiral	75
The gust structure of strong winds	81
The diurnal variations of temperature and humidity	83
Maximum temperatures	85
Minimum temperatures	86
Mean temperatures	88
Diurnal humidity variation	88
Fog	89
Radiation fog	91
Advection fog	92
Upslope fog	93
Inversion fog	94
Turbulent diffusion of air-borne material	94
Adjustment to change of surface character	98
References	100

Dk 551.584

Chapter 3. TOPOCLIMATES

by R. GEIGER

Introduction	105
Radiation on slopes	105
Astronomical theory	106
Screening of the horizon	109
Cloudless skies	111
Direct solar radiation, 111—Diffuse sky radiation, 111—Radiation reflected from the ground, 112—Outgoing radiation, 113—Total effect, 113	
The effect of clouds	114
Construction of radiation maps	116
The climate of slopes	117
The asymmetry of easterly and westerly slopes	117
State of the ground, 117—Cloud, 118	
The effects of wind and precipitation	119
Experimental investigations	120
The climate of valleys	121
The flow of cold air at night	122
The climate in the lower parts of a valley	125
The thermal belt	125
Microclimates in mountainous regions	128
General remarks	128
Topoclimates near the upper tree line	129

The climate of caves	131
Mapping of topoclimates	132
Nature of the problem	132
Methods	133
Construction of the two main types of map	134
Further requirements and possibilities	135
References	136

X Chapter 4. LOCAL WIND SYSTEMS 551, 553
 by H. FLOHN

Introduction	139
Sea and land breezes	140
Heat budget considerations	147
Theoretical experiments on the sea-breeze system	150
Mountain wind systems	155
Theoretical considerations on mountain winds	162
Mechanical effect of mountains	165
References	169

② *hand* X Chapter 5. CLIMATIC FLUCTUATIONS 551, 583
 by H. H. LAMB

Introduction	173
Climatic history	176
Discovery of changes during historical times	176
Discovery of changes of greater magnitude and longer-time scale: ice ages and warm epochs	177
Postglacial time: the evidence of climatic changes	179
Geology and geomorphology, 179—Glaciology, 180—Botany, zoology and marine biology, 180—Human history and archeology, 181—Dating techniques, 182	
Postglacial time: main climatic phases of the last 10,000 years	182
The Postglacial Climatic Optimum (ca. 5000–3000 B.C.), 183—The early Iron Age reversion (ca. 900–450 B.C.), 184—The early Middle Ages warm epoch (ca. 1000–1200 A.D.), 184—The Little Ice Age (ca. 1430–1850 A.D.), 185	
Observations in the era of meteorological instruments	186
Air temperature	187
Sea temperature	191
Sea level	192
Sea ice	193
Rainfall	196
Lake and river levels	199
Glaciers and ice sheets	200
Snow in temperate lands	200
Windiness, gales and hurricanes	202
Other observations	204
Circulation studies	204

Contents

Method: use of monthly mean maps	204
Results: circulation maps and indices since 1750	210
Position shifts and their implications	219
Variability of pressure and pressure patterns	224
Relevance to the whole year and to daily behaviour of the circulation	225
Extension of the circulation analysis to years before 1750.	226
Methods: maps and seasonal anomaly maps	226
Results: character of main epochs	227
Early Middle Ages warm epoch: 1000–1200, 230—Little Ice Age coldest epoch: 1550–1700, 230	
The sequence by decades: incidence of westerlies and of blocking	232
Different sectors compared	238
Nature of the Little Ice Age (ca. 1430–1850 A.D.)	238
Assessment of anomalies in atmosphere and ocean	238
Thermal (1,000–500 mbar thickness) anomalies, 240—Displacements of atmospheric and ocean circulations, 241	
Causes and course of climatic variations: a summary	242
Variations of the energy output of the sun, 243—Variations of other astronomical factors affecting solar distance, 243—Variations of transmission and absorption of solar radiation on passage through the atmosphere, 243—Variations of the albedo of the surface and of the atmosphere, 243—Variations of the amount of heat stored in the oceans, 244—Redistribution of heat stored in the oceans, 244—Changes in the extent of polar ice, 244
