Chapter 1. HUMAN BIOCLIMATOLOGY

by E. FLACH

Introduction	1
History and taxonomy of bioclimatology	2
Basic approach to bioclimatological aspects.	5
Light and life	7
"Light" in geophysical and physiological phenomena	7
Extra-terrestrial solar radiation and illumination intensity, 7—The sense of light, 11	
Climatology of solar and sky radiation, of global illumination intensity, and of circumglobal radiation	14
Global illumination intensity from a general climatological standpoint and in its relation to global radiation, 14—Climatology of global radiation T and its components S and D , 17—Bioclimatological significance of the individual components of solar radiation as well as of circumglobal radiation, 21—Changes of illumination intensity and their relation to reaction times for light impulses, 27	
Taxonomy of energy fluxes active on the earth's surface and their bioclimatological significance.	29
General taxonomy of radiation fluxes active on earth, 29—Structure of human skin in relation to influences of natural radiation, 30	
Ultraviolet radiation	33
Ultraviolet radiation and its biological effects, 33—Climatology of ultraviolet radiation and climatic dosage, 35	
Infrared radiation and radiation balance	39
Infrared radiation and its biological significance, 39—Atmospheric back radiation and heat radiation of the ground and human skin, 40—Radiation balance and its bioclimatological significance, 42	
Further consequences of natural radiation fluxes for practical bioclimatology. . .	44
Radiation related to clothing, 44—Radiation on slanting surfaces and on surfaces facing different directions, 44—Special protective measures against heat and light radiation, 46—Special light effects of a physiological and psychological nature, 47	
Radiation fluxes as aids in the study of atmospheric turbidity.	49
Radiation measurement and air-hygienic orientation, 49—Application of measuring units of atmospheric turbidity and their significance for environmental protection, 51—Light scattering and water pollution, 54	

Air and life	55
Basic aspects of atmospheric air	55
Gaseous composition of air near the ground.	57
Dependence upon altitude of atmospheric pressure and its climatic effects on man	58
Reduction of atmospheric pressure with altitude, oxygen partial pressure and its biological consequences, 58—Influence of altitude on sports, 64	
Physiology of respiration	64
Atmospheric air as a colloid (aerosol).	66
Qualities of the atmospheric aerosol, 66—Aerosol assessment by nuclei and dust counts in different environments (large cities, medium and high mountains, forests, caves), 68—Results of pollen and spore counts, 71	
Special features of atmospheric aerosol.	73
Size spectrum of atmospheric aerosol, 73—Meteorological influences of the constitution of atmospheric aerosol, 76—Electrical characteristics of natural aerosol, 78	
Trace gases in the lower atmospheric layers (questions of environmental protection)	79
Origin of trace gases and their general air-hygienic significance, 79—Special meteorological and air-hygienic influences and analyses of aerosol foreign to the atmosphere, 83—Special trace substances in man's environment, 92—Radioactivity of air and its significance for the biosphere, 96	
Temperature and life	101
Basic aspects of a synthesis of the complex terms temperature and life	101
General thermo-regulatory phenomena in man with regard to the terrestrial and thermal conditions	102
General aspects of heat production and mean tolerance limits	104
Processes of heat production and heat extraction in man.	106
General dependence and processes of heat production and heat emission, 106—Components of the inner and outer heat currents, 107—Evaluation of losses in the heat budget, and physical and chemical heat regulation, 111—Response of skin and tissue temperatures and of skin humidity, 112—The process of perspiration in man under various climatic conditions, including its dependence upon work, 113—Heat and cold acclimatization, 114	
Temperature sensations	117
General aspects of climatic measures, 117—Meteorological influences on skin temperatures, 118—Characterization of thermal environmental influences as well as special measuring techniques for determining "cooling intensity", or "cooling power" and "cooling temperature", 119—Sensation scales and difficulties in their interpretation, 127—Mathematical determination of cooling effects, 127—Complex explanation methods for the determination of the sensation climate of extreme climatic zones, 127—"Sultriness" and its common meteorological interpretation, 135	
Climatological aspects of equivalent temperature in relation to "sultriness" and "comfort"	137
Equivalent temperature as a regular climato-physiological unit for the study of sultriness distributions (Central Europe)	146
Countryside-climatological behaviour of equivalent temperature and cooling power	148
Other methods for characterizing thermal sensations, in particular in connection	

with physiological measures for physical performance and indoor climatological observations	153
Protection against unfavourable climatic effects especially in purely thermal ranges	160
Bioclimatological evaluation systems	163
Basic aspects of spatial evaluation and its scientific implication.	163
Health resort climatology and its problems	164
Methods of research in the thermo-hygric environment for bioclimatological requirements	166
Seasonal differences in thermo-hygric behaviour, 166—Air mass climatology and its relevance to formation of water vapour aerosol, 168	
Thermo-hygric environment as an aid for site evaluations based on aerosol, for the example of Alpine regions	171
Further aspects on the application of aerosol climatology based on thermo-hygric factors	175
Acknowledgement.	177
References	177

Chapter 2. AGRICULTURAL CLIMATOLOGY

by A. Y. M. YAO

Introduction	189
Climatic factors affecting agriculture	189
Radiation	189
Incoming radiation, 190—Outgoing radiation, 190—The energy balance, 191—Spectral distribution of solar radiation, 192—Radiation and light distribution within the plant canopy, 194—Photosynthesis and climate, 197—Photoperiodism, 201	
Temperature	203
Air temperature, 203—Leaf and canopy temperature, 210	
Moisture	214
Precipitation, 214—Soil moisture, 214—Evapotranspiration, 217—Lysimetry, 224—Water requirement for plant growth, 225—Dew, 226—Fog, 227—Humidity, 227	
Wind	227
Wind effect on evapotranspiration, 227—Wind damage to plants, 228—Transportation of pollen, disease, and insects by wind, 228—Wind-profile near the ground, 228	
Agricultural climate	229
Crop climate	230
Rice, 230—Wheat, 233—Corn, 238—Cotton, 240—Soybeans, 243—Tomato, 245—Alfalfa, 248—Apple, 250 .	
Forest climate	251
Radiation, 252—Temperature and humidity, 253—Precipitation, 254—Dew and snow, 255—Wind, 255—Mathematical models, 256	
Animal climate	256
Temperature, 257—Radiation, 258—Air movement, 259—Humidity, 259—Animal breeding and housing, 260	

Contents

Meteorological hazard and weather modification	260
Radiation and heat	260
Modification of radiation and heat near the ground, 260—Frost weather modification, 261	
Moisture	263
Cloud modification, 263—Hail suppression, 264—Drought alleviation, 264	
Wind	268
Windbreaks, 268	
Weather and plant diseases	270
Weather and pathogen	271
The weather and the host	272
Forecasting disease development	272
Agricultural land utilization	273
Climatic classification	275
System analysis of land use in agriculture	275
Remote sensing	276
Remote sensing and agricultural climatology	276
Remote sensing from satellites and agricultural meteorology	277
Weather and crop yield and world distribution of productivity	278
Yield model	278
World distribution of productivity	283
Acknowledgements	283
References	283

Chapter 3. CITY CLIMATE

by H. E. LANDSBERG

Introduction	299
An urban model	300
Thermal field of the city	302
The wind field of the city	313
Atmospheric pollution in cities	317
Radiation, illumination, visibility	321
Humidity, cloudiness, precipitation	324
Conclusion	329
References	330

Chapter 4. TECHNICAL CLIMATOLOGY

by R. REIDAT

Goal and scope of technical climatology	335
The interrelation between technology and weather	335
Engineering demands on climatologists	336
Climatic aids for the engineers	337

Fields of application for technical climatology	342
Indoor climate	342
Heating, 345—Cooling, 346	
Application of climatology to building design	349
Wind, 350—The heat balance of buildings, 352—Moisture in building materials, 360—Rain, 363—Snow, 367—Fog deposit and glaze, 368—Weather construction, 369—Climatic aids for construction engineering, 370	
Climatic conditions during transport	371
Climatic support for industry	373
Air pollution	377
Dust, 377—Waste gases, 378	
References	381
REFERENCE INDEX	387
GEOGRAPHICAL INDEX	400
SUBJECT INDEX	404
