Contents

Foreword	xvi
Preface	xviii
Acknowledgements	xix
1 Terrestrial Hydrometeorology and the Global Water Cycle	1
Introduction	1
Water in the Earth system	2
Components of the global hydroclimate system	4
Atmosphere	5
Hydrosphere	8
Cryosphere	9
Lithosphere	9
Biosphere	10
Anthroposphere	10
Important points in this chapter	12
2 Water Vapor in the Atmosphere	14
Introduction	14
Latent heat	14
Atmospheric water vapor content	15
Ideal Gas Law	16
Virtual temperature	17
Saturated vapor pressure	18
Measures of saturation	20
Measuring the vapor pressure of air	21
Important points in this chapter	23
3 Vertical Gradients in the Atmosphere	25
Introduction	25
Hydrostatic pressure law	26
Adiabatic lapse rates	27
Dry adiabatic lapse rate	27
Moist adiabatic lapse rate	28
Environmental lapse rate	28
Vertical pressure and temperature gradients	29
Potential temperature	30
Virtual potential temperature	31

Atmospheric stability	32
Static stability parameter	32
Important points in this chapter	34
4 Surface Energy Fluxes	36
Introduction	36
Latent and sensible heat fluxes	37
Energy balance of an ideal surface	38
Net radiation, R_n	38
Latent heat flux, λE	39
Sensible heat flux, H	39
Soil heat flux, G	39
Physical energy storage, S_i	40
Biochemical energy storage, P	40
Advected energy, A_d	41
Flux sign convention	41
Evaporative fraction and Bowen ratio	45
Energy budget of open water	46
Important points in this chapter	46
5 Terrestrial Radiation	48
Introduction	48
Blackbody radiation laws	49
Radiation exchange for 'gray' surfaces	51
Integrated radiation parameters for natural surfaces	52
Maximum solar radiation at the top of atmosphere	54
Maximum solar radiation at the ground	56
Atmospheric attenuation of solar radiation	58
Actual solar radiation at the ground	59
Longwave radiation	59
Net radiation at the surface	62
Height dependence of net radiation	63
Important points in this chapter	64
6 Soil Temperature and Heat Flux	66
Introduction	66
Soil surface temperature	66
Subsurface soil temperatures	67
Thermal properties of soil	68
Density of soil, ρ_s	69
Specific heat of soil, c_s	70
Heat capacity per unit volume, C_s	70
Thermal conductivity, k_s	70
Thermal diffusivity, α_s	71
Formal description of soil heat flow	71
Thermal waves in homogeneous soil	72
Important points in this chapter	75

7 Measuring Surface Heat Fluxes	77
Introduction	77
Measuring solar radiation	77
Daily estimates of cloud cover	77
Thermoelectric pyranometers	78
Photoelectric pyranometers	79
Measuring net radiation	80
Measuring soil heat flux	81
Measuring latent and sensible heat	82
Micrometeorological measurement of surface energy fluxes	83
Bowen ratio/energy budget method	83
Eddy correlation method	85
Evaporation measurement from integrated water loss	87
Evaporation pans	88
Watersheds and lakes	89
Lysimeters	90
Soil moisture depletion	91
Comparison of evaporation measuring methods	91
Important points in this chapter	94
8 General Circulation Models	96
Introduction	96
What are General Circulation Models?	96
How are General Circulation Models used?	98
How do General Circulation Models work?	100
Sequence of operations	100
Solving the dynamics	102
Calculating the physics	103
Intergovernmental Panel on Climate Change (IPCC)	104
Important points in this chapter	105
9 Global Scale Influences on Hydrometeorology	107
Introduction	107
Global scale influences on atmospheric circulation	107
Planetary interrelationship	109
Latitudinal differences in solar energy input	109
Seasonal perturbations	109
Daily perturbations	109
Persistent perturbations	109
Contrast in ocean to continent surface exchanges	109
Continental topography	109
Temporary perturbations	110
Perturbations in oceanic circulation	110
Perturbations in atmospheric content	110
Perturbations in continental land cover	110
Latitudinal imbalance in radiant energy	110

Lower atmosphere circulation	111
Latitudinal bands of pressure and wind	111
Hadley circulation	112
Mean low-level circulation	113
Mean upper level circulation	115
Ocean circulation	116
Oceanic influences on continental hydroclimate	118
Monsoon flow	118
Tropical cyclones	119
El Niño Southern Oscillation	120
Pacific Decadal Oscillation	122
North Atlantic Oscillation	123
Water vapor in the atmosphere	123
Important points in this chapter	126
10 Formation of Clouds	128
Introduction	128
Cloud generating mechanisms	129
Cloud condensation nuclei	131
Saturated vapor pressure of curved surfaces	132
Cloud droplet size, concentration and terminal velocity	133
Ice in clouds	134
Cloud formation processes	135
Thermal convection	135
Föhn effect	136
Extratropical fronts and cyclones	138
Cloud genera	140
Important points in this chapter	141
11 Formation of Precipitation	143
Introduction	143
Precipitation formation in warm clouds	144
Precipitation formation in other clouds	146
Which clouds produce rain?	148
Precipitation form	149
Raindrop size distribution	150
Rainfall rates and kinetic energy	151
Forms of frozen precipitation	151
Other forms of precipitation	152
Important points in this chapter	153
12 Precipitation Measurement and Observation	155
Introduction	155
Precipitation measurement using gauges	156
Instrumental errors	157
Site and location errors	157

	Gauge designs	160
	Areal representativeness of gauge measurements	162
	Snowfall measurement	165
	Precipitation measurement using ground-based radar	168
	Precipitation measurement using satellite systems	171
	Cloud mapping and characterization	171
	Passive measurement of cloud properties	172
	Spaceborne radar	173
	Important points in this chapter	174
13	Precipitation Analysis in Time	176
	Introduction	176
	Precipitation climatology	177
	Annual variations	177
	Intra-annual variations	177
	Daily variations	180
	Trends in precipitation	181
	Running means	182
	Cumulative deviations	183
	Mass curve	184
	Oscillations in precipitation	186
	System signatures	187
	Intensity-duration relationships	189
	Statistics of extremes	190
	Conditional probabilities	195
	Important points in this chapter	196
14	Precipitation Analysis in Space	198
	Introduction	198
	Mapping precipitation	199
	Areal mean precipitation	200
	Isohyetal method	200
	Triangle method	202
	Theissen method	202
	Spatial organization of precipitation	203
	Design storms and areal reduction factors	205
	Probable maximum precipitation	207
	Spatial correlation of precipitation	209
	Important points in this chapter	211
15	Mathematical and Conceptual Tools of Turbulence	213
	Introduction	213
	Signature and spectrum of atmospheric turbulence	213
	Mean and fluctuating components	216
	Rules of averaging for decomposed variables	217
	Variance and standard deviation	219

Measures of the strength of turbulence	220
Mean and turbulent kinetic energy	220
Linear correlation coefficient	221
Kinematic flux	223
Advective and turbulent fluxes	225
Important points in this chapter	229
16 Equations of Atmospheric Flow in the ABL	231
Introduction	231
Time rate of change in a fluid	232
Conservation of momentum in the atmosphere	234
Pressure forces	235
Viscous flow in fluids	236
Axis-specific forces	239
Combined momentum forces	242
Conservation of mass of air	243
Conservation of atmospheric moisture	244
Conservation of energy	245
Conservation of a scalar quantity	246
Summary of equations of atmospheric flow	247
Important points in this chapter	247
17 Equations of Turbulent Flow in the ABL	248
Introduction	248
Fluctuations in the ideal gas law	248
The Boussinesq approximation	249
Neglecting subsidence	250
Geostrophic wind	251
Divergence equation for turbulent fluctuations	252
Conservation of momentum in the turbulent ABL	252
Conservation of moisture, heat, and scalars in the turbulent ABL	254
Neglecting molecular diffusion	255
Important points in this chapter	258
18 Observed ABL Profiles: Higher Order Moments	259
Introduction	259
Nature and evolution of the ABL	259
Daytime ABL profiles	261
Nighttime ABL profiles	263
Higher order moments	265
Prognostic equations for turbulent departures	265
Prognostic equations for turbulent kinetic energy	269
Prognostic equations for variance of moisture and heat	271
Important points in this chapter	276

19	Turbulent Closure, K Theory, and Mixing Length	277
	Introduction	277
	Richardson number	277
	Turbulent closure	279
	Low order closure schemes	280
	Local, first order closure	281
	Mixing length theory	283
	Important points in this chapter	288
20	Surface Layer Scaling and Aerodynamic Resistance	289
	Introduction	289
	Dimensionless gradients	290
	Obukhov length	292
	Flux-gradient relationships	293
	Returning fluxes to natural units	294
	Resistance analogues and aerodynamic resistance	296
	Important points in this chapter	299
21	Canopy Processes and Canopy Resistances	300
	Introduction	300
	Boundary layer exchange processes	301
	Shelter factors	306
	Stomatal resistance	308
	Energy budget of a dry leaf	310
	Energy budget of a dry canopy	311
	Important points in this chapter	314
22	Whole Canopy Interactions	316
	Introduction	316
	Whole-canopy aerodynamics and canopy structure	317
	Excess resistance	319
	Roughness sublayer	321
	Wet canopies	323
	Equilibrium evaporation	325
	Evaporation into an unsaturated atmosphere	327
	Important points in this chapter	332
23	Daily Estimates of Evaporation	334
	Introduction	334
	Daily average values of weather variables	335
	Temperature, humidity, and wind speed	335
	Net radiation	337
	Open water evaporation	339
	Reference crop evapotranspiration	341
	Penman-Monteith equation estimation of E_{RC}	342

	Radiation-based estimation of E_{RC}	344
	Temperature-based estimation of E_{RC}	345
	Evaporation pan-based estimation of E_{RC}	346
	Evaporation from unstressed vegetation: the Matt-Shuttleworth approach	348
	Evaporation from water stressed vegetation	353
	Important points in this chapter	355
24	Soil Vegetation Atmosphere Transfer Schemes	359
	Introduction	359
	Basis and origin of land-surface sub-models	359
	Developing realism in SVATS	362
	Plot-scale, one-dimensional 'micrometeorological' models	364
	Improving representation of hydrological processes	367
	Improving representation of carbon dioxide exchange	368
	Ongoing developments in land surface sub-models	370
	Important points in this chapter	373
25	Sensitivity to Land Surface Exchanges	380
	Introduction	380
	Influence of land surfaces on weather and climate	381
	A. The influence of existing land-atmosphere interactions	383
	1. Effect of topography on convection and precipitation	383
	2. Contribution by land surfaces to atmospheric water availability	385
	B. The influence of transient changes in land surfaces	385
	1. Effect of transient changes in soil moisture	385
	2. Effect of transient changes in vegetation cover	388
	3. Effect of transient changes in frozen precipitation cover	389
	4. Combined effect of transient changes	391
	C. The influence of imposed persistent changes in land cover	392
	1. Effect of imposed land cover change on near surface observations	392
	2. Effect of imposed land-cover change on regional-scale climate	393
	3. Effect of imposed heterogeneity in land cover	395
	Important points in this chapter	398
26	Example Questions and Answers	404
	Introduction	404
	Example questions	404
	Question 1	404
	Question 2	405
	Question 3	407
	Question 4	408
	Question 5	410

Question 6	411
Question 7	412
Question 8	414
Question 9	416
Question 10	418
Example Answers	418
Answer 1	418
Answer 2	420
Answer 3	420
Answer 4	425
Answer 5	426
Answer 6	427
Answer 7	429
Answer 8	432
Answer 9	434
Answer 10	437
Index	441
