Part I Introduction	
1. A FIRST IMPRESSION	3
1.1 The ocean basins	4
1.2 Exploration of the oceans	7
1.2.1 A tiny bit of history	7
1.2.2 The modern era	9
1.3 Characteristics of seawater	10
1.3.1 Salinity	10
1.3.2 The surface distribution of temperature and salinity	11
1.3.3 T - S diagrams and water masses	13
1.3.4 Static stability	16
1.4 Exercises on chapter 1	23
2. PRESENT OCEAN CIRCULATION	27
2.1 Forcing fields	28
2.1.1 Wind stress	28
2.1.2 Heat flux	28
2.1.3 Freshwater flux	30
2.2 Ocean circulation	33
2.2.1 Surface circulation	33
2.2.2 Thermohaline circulation	35
2.2.3 Heat and freshwater transport	36
2.3 Oceans and climate	39
2.4 Motivating problems and approach	42
2.4.1 Western boundary currents	42
2.4.2 Internal variability of ocean flows	42

2.4.3	Special equatorial phenomena	44
2.4.4	Phenomena on the planetary scale	44
2.5	Exercises on chapter 2	47
3.	MATHEMATICAL DESCRIPTION	51
3.1	A priori scales	52
3.1.1	Geometry	52
3.1.2	Coriolis acceleration	53
3.1.3	Stratification	56
3.1.4	Mixing of momentum, heat and salt	57
3.1.5	Ratio of scales	59
3.2	Large-scale balances	60
3.2.1	Equations of motion	61
3.2.2	Spherical coordinates	62
3.2.3	Boundary conditions	63
3.3	Dominant balances	65
3.4	Exercises on chapter 3	68
4.	VORTICITY	71
4.1	The vorticity equation	72
4.2	Vorticity transport	73
4.2.1	Vortex stretching and tilting	73
4.2.2	Baroclinic vorticity production	74
4.2.3	Diffusion of vorticity	76
4.3	Potential vorticity	77
4.4	Shallow-water equations	79
4.4.1	Hydrostatic equilibrium	79
4.4.2	Inertial flows	81
4.5	Exercises on chapter 4	86
Part II Midlatitude circulation		
5.	WIND-DRIVEN CIRCULATION	91
5.1	The North Atlantic surface circulation	92
5.2	The barotropic circulation on the β -plane	94
5.2.1	The β -plane approximation	94
5.2.2	Boundary conditions	97
5.2.3	Model equations	98
5.3	Stationary solutions	99
5.3.1	The geostrophic flow	103
5.3.2	The bottom Ekman layer	105
5.3.3	The free surface Ekman layer	110
5.3.4	Continuity of the vertical velocity	113

5.4	The barotropic vorticity equation	118
5.5	Exercises on chapter 5	123
6.	WESTERN INTENSIFICATION	127
6.1	The Sverdrup balance	128
6.2	Continental boundary layers	131
6.2.1	The Munk boundary layer	135
6.2.2	The Stommel boundary layer	137
6.2.3	Physics of the western intensification	140
6.3	The inertial boundary layer	142
6.4	Highly nonlinear flows	144
6.5	Exercises on chapter 6	150
7.	FREE WAVES	155
7.1	Small amplitude motions	156
7.2	Free waves: H_0 constant	158
7.2.1	Unbounded domain	158
7.2.2	Zonal channel	160
7.3	Free waves: $H_0 = H_0(y)$	164
7.4	Free waves in the quasi-geostrophic model	167
7.5	Exercises on chapter 7	170
8.	STRATIFICATION	173
8.1	Rotation versus Stratification	174
8.2	Potential vorticity (again ...)	177
8.3	The stratified quasi-geostrophic model	179
8.3.1	Model formulation	179
8.3.2	Boundary conditions	183
8.4	Free waves	185
8.4.1	Vertical structure functions	185
8.4.2	Properties of Rossby waves	187
8.4.3	Topographic Rossby waves	189
8.5	Exercises on chapter 8	193
9.	ADJUSTMENT	197
9.1	The quasi-geostrophic two-layer model	198
9.2	Free waves	201
9.3	Adjustment in a rectangular basin	203
9.3.1	Possible responses	204
9.3.2	The spin-up problem	206
9.4	Exercises on chapter 9	213

10. STABILITY OF ZONAL FLOWS	217
10.1 Quasi-geostrophic theory	218
10.2 Barotropic instability	220
10.3 The Eady model	224
10.4 Mechanism of baroclinic instability	227
10.5 The Phillips model	230
10.6 Exercises on chapter 10	235
Part III Equatorial circulation	
11. EQUATORIAL OCEAN CIRCULATION	241
11.1 Characteristics	242
11.2 Equatorial ocean models	246
11.2.1 Constant density equatorial β -plane model	246
11.2.2 The reduced gravity model	248
11.3 The Equatorial Counter Current	249
11.4 Equatorial waves	252
11.5 Forced response in a basin	260
11.6 The equatorial thermocline	266
11.7 Exercises on chapter 11	270
12. DYNAMICS OF ENSO	273
12.1 Basic Phenomena	274
12.2 A coupled ocean-atmosphere system	277
12.2.1 Processes determining the SST	278
12.2.2 Wind induced ocean flow anomalies	279
12.2.3 Feedbacks	281
12.3 The delayed oscillator view of ENSO	282
12.4 Exercises on chapter 12	289
Part IV Planetary circulation	
13. THERMOCLINE PROBLEM	295
13.1 Characteristics of the thermocline	296
13.2 Formulation of the problem	298
13.3 The constant density planetary circulation	299
13.3.1 The bottom Ekman layer	300
13.3.2 The free surface Ekman layer	302
13.3.3 The planetary Sverdrup-Stommel theory	304
13.4 The planetary two-layer model	306
13.5 Thermocline theory	309

13.5.1	Ventilation theory	309
13.5.2	The internal boundary layer model	317
13.6	Exercises on chapter 13	324
14.	ANTARCTIC CIRCUMPOLAR CURRENT	327
14.1	Observations	328
14.2	The barotropic channel model	332
14.2.1	Flat bottom case	333
14.2.2	The role of bottom topography	334
14.3	Stratification	341
14.3.1	Stationary baroclinic flows	341
14.3.2	Time dependent phenomena	345
14.4	Exercises on chapter 14	349
15.	ARCTIC OCEAN CIRCULATION	351
15.1	Characteristics	352
15.2	Quasi-geostrophic flows with topography	355
15.2.1	Geostrophic contours	355
15.2.2	Steady flows with closed geostrophic contours	358
15.3	An idealized model of the Arctic circulation	365
15.4	Application to the Arctic basin	368
15.5	Exercises on chapter 15	372
16.	THERMOHALINE CIRCULATION	375
16.1	Past climate variability	376
16.2	The Stommel two-box model	379
16.3	Equilibrium solutions	384
16.4	Stability of equilibrium solutions	386
16.5	Physical mechanisms	388
16.5.1	Advective feedback	388
16.5.2	Convective feedback	389
16.6	Exercises on chapter 16	394
	Bibliography	397
	Index	405
